# Dispersers

## Applications

VOLLRATH-Dispersers are mainly used to disperse pigment, fillers and other powders into liquids or pastes. The large agglomerates being broken down and the solid particles wetted out.

## Principle

The principle of the VOLLRATH High Speed Disperser is to use a specially shaped toothed disc at a very high peripheral tip speed. This ensures that large stress forces break down the agglomerates

into the liquid or paste suspension.

## High performance and efficiency

The high power density, the large speed range and the constant power of the variable speed frequency inverter drive gives the VOLLRATH-Disperser excellent efficiency and maximum flexibility, along with the built-in overload control, which ensures safe and easy processing of all products.

## Optimisation

To create maximum shear rate at the premix stage the product is normally worked into a high viscosity liquid or paste, before adding the rest of the liquid, which had been held back.

The following options can be supplied by VOLLRATH to optimise the processing:

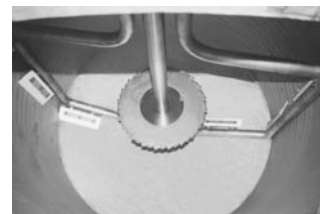

- Higher viscosity products are best processed with the Disperser-Suction-Disc to move the whole batch efficiently.
- Other types and sizes of disc can also be used to suit the particular product to be processed.
- Wall and bottom scraping systems can be added – when the Dispersers are used with a wall and bottom scraper, highly viscous products can be easily processed.
- Vessels can be fitted with heating or cooling jackets.
- Dispersers with conical vessels are normally supplied when a large variation in batch sizes or the whole process has to take place in one vessel.
- VOLLRATH can also supply Disperser of special execution that can be developed with the customer.
- Universal - Mixing - Dispersers with up to three mixing systems, like the Type VDMP, can be supplied for a wide range of products.

Disperser-Suction-Disc

Axial-Suction-Disc

Wall and Bottom-Scraper

## Laboratory and Trials

The VOLLRATH-Laboratory and demonstration room is available for trials to ensure correct selection of equipment to suit customer's particular requirements.

An adaptation of formulation can be necessary to reach optimal results.

## Explosion-proof protection (ATEX)

Dispersers can be supplied according to EC Directive 94/9/EG (ATEX) for use in all zones including zone O. Notified body (PTB) certificates are available where required.

## Vacuum-Dispersers

The option "vacuum" is available for the most VOLLRATH-Dispersers.

## Construction and Service

All VOLLRATH-Dispersers are solidly built and designed to give a trouble free long service life.

## Laboratory-Dispersers

Type	Disc Ø mm	Power kW	Speed min <sup>-1</sup>	Lift mm	Container Ø mm	Volume l
VDTMH 0,5	30/40	0,3	0-12000	300	60-130	0,15-1,5
VDTMH 2	40/50/65	1,1	0-12000	300	75-200	0,25-8

Not available in Ex version.

## Laboratory- and Pilot-Plant-Dispersers

Type	Disc Ø mm	Power kW	Speed min <sup>-1</sup>	Lift mm	Container Ø mm	Volume l
VDT 1*	40/50/65	1,1	295-10200	300	75-200	0,25- 8
VDT 2,1	65/80/100	1,5	295- 8500	400	100-300	1 -15
VDT 3	80/100/125	2,2	295- 5700	400	175-350	4 -25

\* Optional with chamber and grinding disc to operate as **Laboratory-Bead-Mill**.

**Dispersers**  
Bead-Mills  
Mixers  
Stirrers

To comply with local environmental and safety regulations our wall and stand mounted dispersers are often supplied with lids.

The lid is fixed to the machine head on slides. This allows up and down movement of the disperser disc over its working area, to obtain the optimal mixing effect (Vortex), whilst the lid remaining in contact with the vessel/drum. Lids are fitted with large charging chutes allowing ingredients to be added (with the mixer operating) straight into the vortex. Fast incorporation of the ingredients is therefore ensured.

Sample:

**Disperser Type VDWG 15**

**with EC-Type Examination Certificate for "Zone 0".**

Disperser fitted with the electro-mechanical lifting option can easily be raised and lowered for vessel/drum removal, along with fine adjustment of the working height to suit mixing requirements.

These mixers offer excellent price/performance ratios.

## Explosion Protection

Explosion proof Dispersers with lid or fixed, enclosed systems are normally "Zone 0" (Category 1) rated inside the vessel.

Marking of machines for "Zone 0" / Zone 1

VDS-VA 180	700	132	60- 700	1800	1800	4000

## Special Features

- Vacuum lid is mounted elastic to Dispersers head.
- There is a linear vacuum seal between Dispersers head and vacuum lid.  
This allows up and down movement of the disperser disc over its working area, to obtain the optimal mixing effect (Vortex), while the lid is closed and Vacuum is given.
- Big rectangular filling mouth with bag support and cover.
- EC-Type Examination Certificate for "Zone 0" available.

## Tank-Mounted-Disperser

The "VOLLRATH-Tank-Mounted-Disperser" is a very robust Dissolver, which can be used to process a wide variety of products. The speed of the main shaft is adjustable over its full working range by the frequency inverter, which along with the hydraulic height adjustment allow optimal processing. The optional Anchor, with by-directional, spring loaded side wall and bottom scrapers allow even more processing options. Being top mounted and of a very robust design removes the need for bottom bearings or sealing arrangements within the vessel.

Other options include: Vacuum execution; Conical vessel bottom, which allows the possibility to start processing with a very low quantity of liquid; Heating/cooling using either a double jacket or welded half pipes; Clean In Place high or low pressure system can be mounted on the cover on request.

Special feet plates or sidewall brackets can also be supplied for load cells applications.

## Universal-Mixing-Disperser

The "VOLLRATH-Mixing-Disperser" is a universal device ideal for the processing of higher viscosity products with scraper, disperser and mixer.

Using all three elements; the slow speed rotor to incorporate the ingredients into the batch; the high speed disperser to break down and disperse powders into the liquid; the anchor with wall and bottom scrapers to clear the vessel surfaces of product and feed the product into the working areas of the mixer and disperser.

This ensures a quick and homogeneous processing.

Using just the mixer and anchor, and if required with the disperser running slowly more delicate additions to the process can be added without damaging them.

Higher viscosity products up to approximately **900,000 mPas** including adhesives, fillers, sealing compounds, foundry coatings, decorative plasters, masonry paints, primers and dispersion paints, can be easily processed with the "VOLLRATH-Mixing-Disperser".
