# BATTERY CHARGER & AC UPS

ACM-1, BCC-24E/24F, UPC-1/3

## GENERAL INFORMATION

The Battery charger controllers are high quality products combined with related functions and especially developed to be easily applied to marine system, power plant, steel, chemical plant and other places where the battery should be needed. They comply with various international standards, and standardized circuit is adopted. In addition to a basic functions, the controller has applicable functions, and control circuit consist of high quality components up to various standards.

The charger adopts a constant voltage and a constant current as a basic charging method.

And the termination of charging is defined by calculating a voltage differential coefficient( $dV/dt$ ) and a current differential coefficient( $dI/dt$ ) and adding a supplementary charging time.

[ACM-1<sup>(R2)</sup>] controller has float and trickle charging.

It is possible to adjust Floating and Trickle voltage by using a VR.

It is possible to select the mode by using a trickle and floating mode button.

[BCC-24E<sup>(R2)</sup>] controller has float and equalize charging.

It is possible to adjust Floating and Equalizing voltage by using a VR.

Equalize charging time should be adjusted different according to the ambient temperature.

It is possible to select the mode by using a equalize and float charging button.

[BCC-24F<sup>(R2)</sup>] controller is only a float charging.

## ORDERING INFORMATION

Control circuits are different from one another in their operation according to their systems.

The following are applicable models. Please select the applicable model according to the plan of the system and the specification on this operation manual.

## GENERAL INFORMATION

UPS is an electrical apparatus that provides emergency power to a load when the input power source, typically mains power, fails.

AC UPS differs from an auxiliary or emergency power system or standby generator in that it will provide near.

instantaneous protection from input power interruptions, by supplying energy stored in batteries or a flywheel.

UPS is typically used to protect computers, data centers, telecommunication equipment or other electrical equipment where an unexpected power disruption could cause injuries, fatalities, serious business disruption or data loss. UPS units range in size from units designed to protect a single computer without a video monitor (around 200 VA rating) to large units powering entire data centers or buildings.
