

Method of Lubrication

There are three basic methods of lubrication for roller chain drives. Close adherence to these recommended types of lubrication is essential in obtaining the maximum service life of a chain drive. These recommended types of lubrication, as shown in the (Kilowatt Rating Tables), are determined by the chain speed and the amount of power transmitted.

Type of Lubrication		Lubricating Method	Lubrication amount & Method	Attention
A	I	 <p>Manual Lubrication Oil is applied with a oil filler or oil brush on the slack side of the chain</p>	<p>–It should be applied about every 8 hours or as often as necessary to prevent the bearings from becoming dry.</p>	<p>–Do not attempt to manually lubricate of service any chain while it is operating. Serious injury could result. –Acceptable for slow speed : generally not over 200m/ min</p>
	II	 <p>Drip Lubrication The oil is supplied by drip feed by using oil casing</p>	<p>–About 5 to 20 drops of oil per min. or as enough as necessary to prevent the chains from over heating</p>	<p>–According to change of the speed, should increase amount. –Acceptable for slow speed : generally not over 200m/ min</p>
B	I	 <p>Oil Bath Lubrication The Chain is installed in a leakless casing.</p>	<p>–The oil depth 'H' should be 6 to 12mm deep. –The oil level should be such that the pitch line of the chain is just submerged.</p>	<p>–This method is suitable for chains operating at up to approximately 450m/min –To prevent excessive heat generation, only a short section of chain should run through the bath.</p>
	II	 <p>Lubrication by Slinger Disc The Chain is installed in a leakless casing and oil is splashed on the chain.</p>	<p>–The oil depth 'H' should be 12 to 25mm deep. –If the width of the chain is larger than 125mm, attach slinger discs to both side.</p>	<p>–The circumferential speed should be at least 200m/min. –The chain should not pass through oil</p>
C		 <p>Forced Feed Lubrication Lubricant is pumped onto the chain under pressure.</p>	<p>–This is the preferred method of lubrication, particularly for drives with heavy loads or high speeds. –Use for speeds higher than Type B limit and for chains operating at up to approximately 760m/ min.</p>	<p>–The oil should be directed to the inside of the slack strand with one oil stream for each 1 inch of chain width.</p>
