## 1. Features

IR-22 non-contact infrared thermometer measures the infrared wavelength emitted from the target spot and converts it to standard current signal output (4~20mA) and RS-485 communication signal output.

It can measure from -60 °C to maximum 380°C and RS-485 communication enables to store data in computer.

IR-22 has a high precision by adopting optical lens which can enable to measure target exactly at a long distance through its 10:1 D:S (Distance to Spot).

### ● Applications

Plastics, Fluids, Rubber, Coated components, Asphalt, Wood, Paper, Ceramics, Textiles, Glass, Food etc.

## 10. Installation

- Please make sure the target area is larger than the field of view.

- The spot size is decided by the distance from the sensor to the target.
- Please refer to the 'section 5. Optical field of view' and make sure your target area is larger than the field of view.

- Please locate the sensor vertical against the target.

- It is the best for you to install the sensor vertical against the target area or object. If it is not available, the sensor should be more than  $45^\circ$  against the target area. Otherwise, it can affect the measuring accuracy.

- Please avoid the heat reflection from other high temperature materials

- Please avoid highlight.

- Please avoid electronic noise.

Please avoid the high frequency or high voltage area such as motor, pump, power line, and so on.
