

High-quality High-performance **WON** Linear Motion Guide

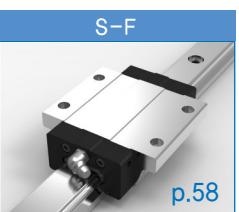

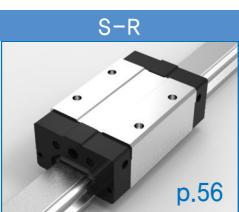

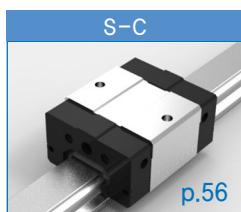

WON ST Linear Motion Guide is a four-row circular face-to-face duplex structure and a 4-direction equal load type which is excellent in bearing high load with high rigidity as well as compatibility between a rail and a block, and allows smooth and precise operation.

WON
LINEAR MOTION SYSTEM

LINEAR MOTION GUIDE

WON

1 WON Linear Motion Guide

1. Characteristics

WON Linear Motion Guide is a straight-line motion bearing with the structure in which rolling elements such as balls or rollers softly circulate the inner part of the block and the block can make an infinite straight-line motion along the raceway surface of a rail.

2. Strengths

1) Able to make a precise positioning

Since there is less difference between static friction and kinetic friction as well as in speed-induced friction fluctuation, it excellently responds even to micro-migration, allowing precise positioning.

2) Able to maintain accuracy stably for a long time

Less friction coefficient and wear due to ideal rolling motion allows the stable maintenance of accuracy for a long time.

3) Able to eliminate clearance or increase rigidity by preloading

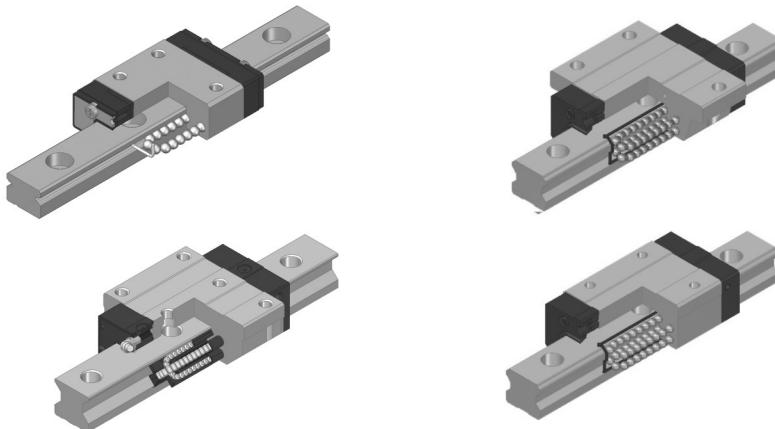

It is possible to eliminate clearance by using rolling elements such as a ball or a roller or increase rigidity of Linear Motion Guide by preloading.

4) Lubrication is simple.

Lubrication is simple but it uses grease or oil which makes it convenient to maintain.

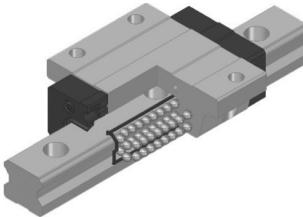

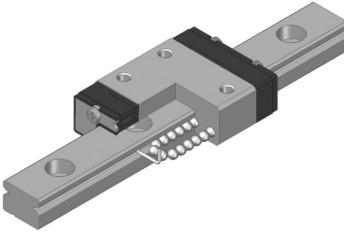

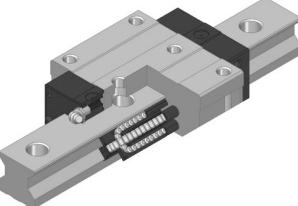

5) Able to compact equipment and save cost for operating electricity

It can be made into compact miniaturized equipment because friction is low despite highly-rigid high-loading, which saves manufacturing costs and energy.

3. Types

WON ST offers various types of Linear Motion guide from miniature types to general ball Linear Motion guide to low-sound linear motion guide to ultra high-rigid roller linear motion guide. Since each supports different shapes and sizes according to service conditions, you can select the optimal linear motion guide to each usage.

Linear Motion Guide	 A 3D rendering of a standard ball linear motion guide. It consists of a long, horizontal metal rail with two black plastic end caps. A black ball-bearing carriage is positioned on the rail, featuring a ribbed side plate and a mounting flange with two circular holes.	<ul style="list-style-type: none">·World standard ball Linear Motion guide·4-direction equal load type with 40°contact angle·Great error-absorbing ability with D/F combination·High-rigid highly accurate straight-line motion through ideal rolling motion
Miniature Linear Motion Guide	 A 3D rendering of a miniature linear motion guide. It is a compact version of the standard guide, designed for smaller applications. It features a shorter rail and smaller end caps, while maintaining a similar carriage design with a ribbed side plate and a mounting flange.	<ul style="list-style-type: none">·Miniature high-rigidity·Various shapes and sizes·Highly-durable and reliable compact straight-line motion device
Roller Linear Motion Guide	 A 3D rendering of a roller linear motion guide. It features a unique carriage design where the wheels are integrated directly into the side plates of the carriage, eliminating the need for a separate wheel assembly. This results in a more compact and rigid design compared to standard ball guides.	<ul style="list-style-type: none">·Roller-enabled ultra-rigid linear motion guide·4-direction equal load type with 40°contact angle·Able to run reliably for a long time through rolling motion having wide contact surface·High-load, high-rigid, highly accurate straight-line motion

2 Selection of Linear Motion Guide

1. Overview

To select Linear Motion guide, most of all identify detailed requirements and prioritize the requirements to select the Linear Motion Guide suitable for the service conditions.

2. Procedure

- | | |
|--|---|
| 1 Identify service conditions | equipment, maintenance structure, installation space, assembly status, functional requirements, service conditions |
| 2 Select the type of Linear Motion guide | Select the appropriate type by considering motion condition, load level, rigidity, friction, and assembly |
| 3 Select the model number of Linear Motion guide | Determine the model number and the quantity of blocks by considering the space and load |
| 4 Calculate load | Calculate the load in vertical and horizontal directions and moment |
| 5 Calculate equivalent load | Calculate each load applied to the block by converting it into equivalent load |
| 6 Calculate mean load | Calculate each load applied to the block and variable load during deceleration by converting them into mean load |
| 7 Calculate static safety factor | Calculate the static safety factor identified by basic load rating and max. equivalent load and check if it fits for service conditions |
| 8 Calculate life | Check if it fits for service conditions by calculating load rating and life |
| 9 Review preload & clearance | Select the preload and clearance suitable for service conditions |
| 10 Determine the class of precision | Determine the class of precision required by Linear Motion guide while driving |
| 11 Lubrication, dust proof, surface handling | Select lubricant suitable for the environment using grease, oil, and special grease lubrication and select seal for dust proof / determine the method of surface handing for rust prevention and low dust raise |
| 12 Complete selection | Complete the decision of final specifications of Linear Motion guide |

3 Life Calculation

1. Load rating and life

(1) Life

If external load is applied to Linear Motion guide while driving, fatigue fracture occurs by stress created as load is repeatedly applied to the raceway surface and rolling elements, and flaking -peeling off in scale-like flakes arises. A total driving distance until flaking occurs due to initial fatigue fracture is the life of a linear motion guide.

- Defects may occur in Linear Motion guide earlier than when flaking normally occurs due to wear or fatigue in the following cases:

- Excess load by the imprecise assembly following a difference in temperature or tolerance
- If Linear Motion guide is contaminated with foreign substance
- Driving with insufficient lubrication
- Reciprocating motion in a very short distance in the form of vibration or wave during the halt or drive
- Excessive load to Linear Motion guide
- Deformation of plastic end-plate

2) Rating fatigue life L

Generally Linear Motion guide does not always have same life even though the products are manufactured in the same way because of the difference in scattering of raw material's original fatigue. For this reason, the reference value of life is defined as the rating fatigue life which is a total driving distance that flaking does not occur in 90% of Linear Motion guides in a group when having them run under the same conditions by grouping multiple Linear Motion guides with same specifications into a group.

When using a ball

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

When using a roller

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

(3) Basic dynamic load rating C

Basic dynamic load rating is Linear Motion guide's bearing of load which represents an applicable constant load in direction and magnitude when the rated life is 50KM. The reference value of WON Linear Motion Guide's basic dynamic load rating is 50KM (ball type) and 100KM (roller type). It is used for calculating Linear Motion guide's life while driving under constant load in magnitude from the center of a block to bottom.

Each value of basic dynamic load rating (C) is stated in the catalogue.

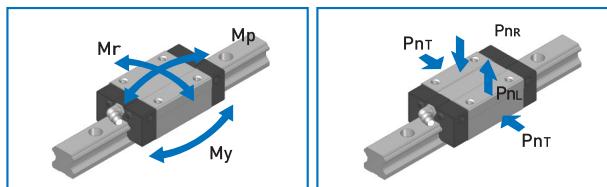

(4) Basic static load rating C₀

If Linear Motion guide is applied by excessive load or attached instantly by big impact load, a partially permanent deformation occurs between a rolling element and the raceway surface. If deformation reaches to a certain extent, it hinders a smooth driving. Basic static load rating is defined as the constant static load in direction and magnitude with the permanent deformation that occurs between a rolling element like a ball or a roller and the raceway surface of block and rail 0.0001 times bigger than the diameter of the rolling element. In Linear Motion guide, it is the load applied from top to bottom based on the center of the block. Each value of basic static load rating (C₀) is stated in the specification table.

(5) Static allowable moment Mo

Moment load can be applied to Linear Motion guide. Here, a ball or a roller both at the ends is most stressed due to the stress distribution of a ball or a roller which is the rolling element inside Linear Motion guide. Static allowable moment refers to the constant moment load in direction and magnitude when the permanent deformation between a ball or a roller applied with the biggest stress and the raceway surface of a block or a rail is less than 0.0001 of the diameter of the rolling element. Moment values of three directions (M_p , M_y , M_r) are stated in the specification sheet. Static allowable moment (M_o) and static moment load rating (M_p) can be reviewed by applying safety factor (f_s).

Directions of load and moment

$$f_s = \frac{M_p}{M_o}$$

2. Load Calculation

Linear Motion guide bears basic dynamic load rating (C) and basic static load rating (C_0). But compression load applied from top to down due to inertia force created by the center of gravity, positioning thrust, acceleration, cutting force, and deceleration as well as various loads including tensile load, horizontal load, and moment load can be applied to Linear Motion guide depending on the service conditions. In this case, load of Linear Motion guide changes. When selecting Linear Motion guide, it is required to review these conditions and calculate proper load.

3. Service Condition Setting

Service conditions necessary for calculating the load and life of Linear Motion guide :

- | | | | |
|---|----------------------------------|--|--|
| ① Mass : | m(kg) | ⑥ Velocity diagram | Velocity : $V(\text{mm/s})$ |
| ② Applicable load direction | | | Time constant : $t_n(\text{s})$ |
| ③ Point of application :
(center of gravity) | $\ell_2, \ell_3, h_1(\text{mm})$ | | Acceleration : $\alpha_n(\text{mm/s}^2)$ |
| ④ Point of thrust : | $\ell_4, h_2(\text{mm})$ | ⑦ No. of reciprocating motion/second : | $N_1(\text{min}^{-1})$ |
| ⑤ Composition of Linear Motion guide :
(No. of block & rail) | $\ell_0, \ell_1(\text{mm})$ | ⑧ Stroke : | $L_s(\text{mm})$ |
| | | ⑨ Avg. velocity : | $V_m(\text{m/s})$ |
| | | ⑩ Required life : | $L_h(\text{h})$ |

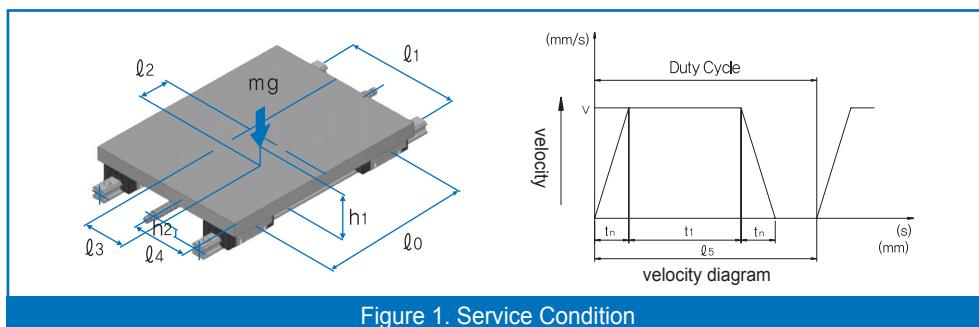

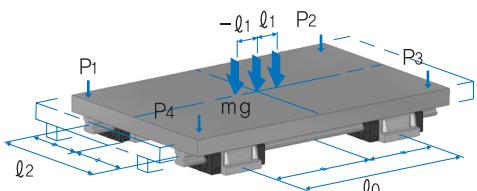

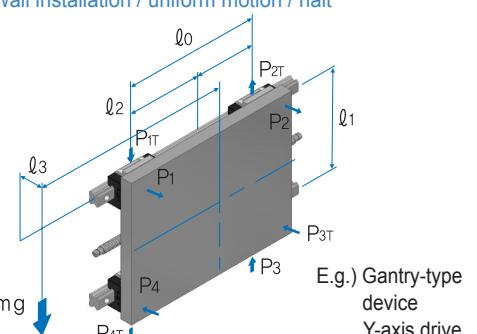

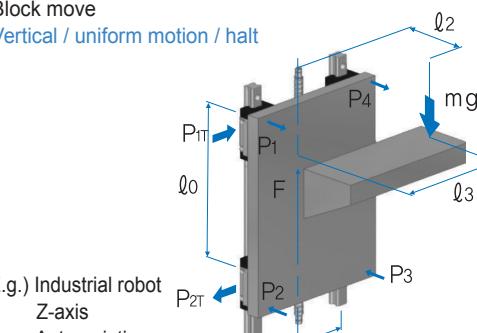

Figure 1. Service Condition

4. Load Calculation Formula

Load applied to Linear Motion guide changes due to external forces such as the center of gravity, position of thrust, acceleration, and cutting resistance. To select Linear Motion guide, you should calculate load applied to the block by fully considering the conditions below.

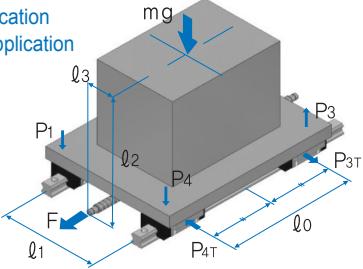

m : Mass l_n : Distance F_n : Thrust P_n : Load (vertical, reverse-vertical) P_{nt} : Load (horizontal)	(kg) (mm) (N) (N) (N)	g : Acceleration of gravity($g : 9.8\text{m/s}^2$) V : Velocity t_n : Time constant a_n : Acceleration	(m/s 2) (m/s) (s) (m/s 2)
---	-----------------------------------	---	--

Case	Service Conditions	Load Calculation Formula
1	Block move Horizontal / uniform motion / halt	$P_1 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_2 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_3 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_4 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$
2	Block move Overhang-horizontal / uniform motion / halt	$P_1 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_2 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} + \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_3 = \frac{mg}{4} - \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$ $P_4 = \frac{mg}{4} + \frac{mg \cdot l_2}{2 \cdot l_0} - \frac{mg \cdot l_3}{2 \cdot l_1}$

5. Equivalent Load Calculation

There are diverse kinds of load applied to Linear Motion guide, such as compression load in vertical direction, tensile load, horizontal load, moment load, etc. There is also combined load of them and sometimes the magnitude and direction of load change. Since it is hard to calculate the variable load when calculating the life of Linear Motion guide, it is required to use equivalent load which is converted to compression load or tensile load in vertical direction in order to produce life or static safety factor.

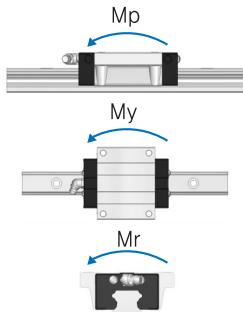

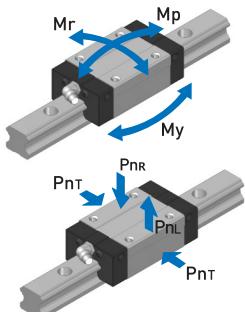

6. Equivalent Load Calculation Formula

If Linear Motion guide bears vertical compression load or tensile load or horizontal load simultaneously, or the magnitude or direction of load changes, equivalent load is calculated using the following formula.

$$P_E(\text{equivalent load}) = P_n + P_{nT}$$

P_n : Compression load

P_{nT} : Horizontal load

P_n : Compression load

P_L : Tensile load

P_{nT} : Horizontal load

M_p : Pitching moment

M_y : Yawing moment

M_r : Rolling moment

Figure 2.

7. Static Safety Factor Calculation

Unexpected big load may be applied to Linear Motion guide due to inertia force caused by vibration impact or quick braking and moment load of mechanical structure. When selecting Linear Motion guide, static safety factor must be taken into account to be ready for such load. Static safety factor (f_s) is shown in value obtained by dividing basic static load rating by the calculated load. To see the baseline of static safety factor by service condition, please refer to Table 1-1 and Table 1-2.

Table 1-1 Baseline of static safety factor(s)

Type of rolling element	Service condition	Static safety factor (f_s)
Ball	There is no vibration and impact.	1.0 ~ 1.5
	Great travel performance is needed.	1.5 ~ 2.0
	There are moment load, violation, and impact.	2.5 ~ 7.0
Roller	There is no vibration and impact.	2.0 ~ 3.0
	Great travel performance is needed.	3.0 ~ 5.0
	There are moment load, violation, and impact.	4.0 ~ 7.0

Table 1-2

If compression load is big	$\frac{f_H \cdot f_T \cdot f_C \cdot C_0}{P_n} \geq f_s$
If tensile load is big	$\frac{f_H \cdot f_T \cdot f_C \cdot C_{0L}}{P_L} \geq f_s$
If horizontal load is big	$\frac{f_H \cdot f_T \cdot f_C \cdot C_{0T}}{P_{nT}} \geq f_s$

f_s : Static safety factor

P_L : Calculated load (reverse-vertical) (N)

C_0 : Basic static load rating(vertical)

(N) P_{nT} : Calculated load (horizontal) (N)

C_{0L} : Basic static load rating(reverse-vertical)

(N) f_H : Hardness factor

C_{0T} : Basic static load rating(horizontal)

(N) f_T : Temperature factor

P_n : Calculated load(vertical)

(N) f_C : Contact factor

8. Mean Load Calculation

Load applied to the block of Linear Motion guide is not constant, but differs according to service conditions. Here the load that becomes equal to life under variable load is used. This is called mean load. If the load applied to block is changed due to external condition, it is required to calculate life as mean load that includes various conditions as below. If load applied to block varies with different conditions, life should be calculated by including this variable load condition. Mean load (P_m) refers to constant load that becomes equal to life under this variable load when the load applied to block changes with various conditions while traveling.

$$P_m = \sqrt[3]{\frac{1}{L} \cdot \sum_{n=1}^i (P_n \cdot L_n)}$$

P_m : Mean load (N)

P_n : Variable load (N)

L : Total travel distance (mm)

L_n : Travel distance by loading P_n (mm)

i : Ball - 3, Roller - 10/3

Note) the formula above or formula (1) below is applied to a ball.

1) Change in phase

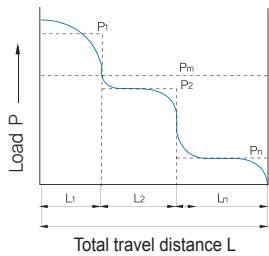

$$P_m = \sqrt[3]{\frac{1}{L} (P_1^3 \cdot L_1 + P_2^3 \cdot L_2 + \dots + P_n^3 \cdot L_n)} \quad (1)$$

P_m : Mean load (N)

P_n : Variable load (N)

L : Total travel distance (mm)

L_n : Travel distance by loading P_n (mm)

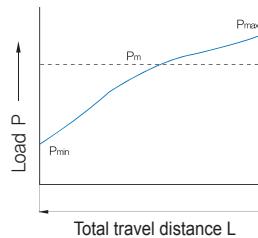

2) Change monotonously

$$P_m \approx \frac{1}{3} (P_{min} + 2 \cdot P_{max}) \quad (2)$$

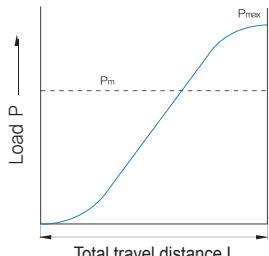

P_{min} : Minimum load (N)

P_{max} : Maximum load (N)

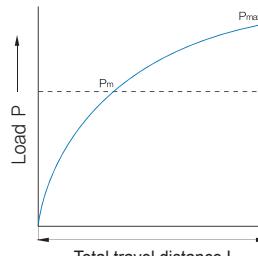

3) Change in a sine curve

a) $P_m \approx 0.65 \max$ (3)

b) $P_m \approx 0.75 \max$ (4)

9. Rating Life Calculation

Rating life needs to be calculated because Linear Motion guide's life differs even under same working conditions. Rating life of Linear Motion guide is the total travel distance that a Linear Motion guide system composed of a certain number of units can drive until flaking does not occur in 90% of the raceway surface or rolling elements after being run under same working conditions. If a ball or a roller is used as a rolling element, rating life can be calculated using the following formula.

▶ Calculation formula of the rating life of ball-enabled Linear Motion guide

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

L	: Rating life	(km)
C	: Basic dynamic load rating	(N)
P_c	: Calculated load	(N)
f_H	: Hardness factor	See Fig. 3
f_T	: Temperature factor	See Fig. 4
f_C	: Contact factor	See Table 2
f_w	: Load factor	See Table 3

▶ Calculation formula of the rating life of roller-enabled Linear Motion guide

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

L	: Rating life	(km)
C	: Basic dynamic load rating	(N)
P_c	: Calculated load	(N)
f_H	: Hardness factor	See Fig. 3
f_T	: Temperature factor	See Fig. 4
f_C	: Contact factor	See Table 2
f_w	: Load factor	See Table 3

▶ If the length of stroke and the number of reciprocating motion are constant, life time can be calculated using rating life (L) by the formula below.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

L_h	: Life time	(N)
l_s	: Length of stroke	(mm)
n_1	: No. of reciprocating motion per minute	(mm ⁻¹)

1) Hardness factor (f_H)

To realize the best performance of Linear Motion guide, the proper hardness and depth should be maintained between the block contacting a rolling element (ball or roller) and the raceway surface of rail. WON Linear Motion guide has HRC58-64 surface hardness, so there is no need to consider hardness factor. But if the hardness is lowered than baseline, Linear Motion guide's load capacity decreases; so hardness factor needs to be reflected in calculating life.

WON Linear Motion guide has HRC58-64 surface hardness, so there is no need to consider hardness factor. But if the hardness is lowered than baseline, Linear Motion guide's load capacity decreases; so hardness factor needs to be reflected in calculating life.

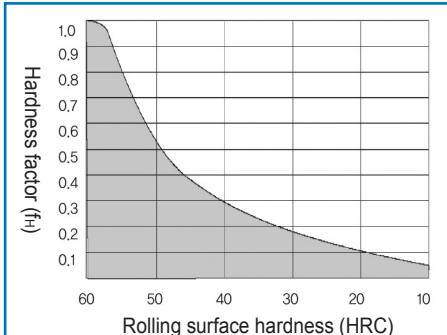

Figure 3. Hardness factor (f_H)

2) Temperature factor (f_T)

If high temperature over 100°C is applied to Linear Motion guide, temperature factor (f_T) needs to be taken into account when selecting Linear Motion guide. WON Linear Motion guide must be used at less than 80°C. But you have to use it at over 80°C, please use a high-temp Linear Motion guide - WON ST's specially customized product.

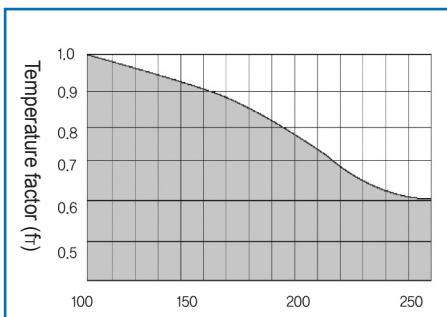

Figure 4. Temperature factor (f_T)

Note) In ambient temperature of over 80°C, materials for seal, end plate, and support plate should be changed to the specifications for high temperature.

3) Contact factor (f_C)

If over two blocks of Linear Motion guide are closely assembled, since uniform load may not be applied to blocks due to difference among mounting surfaces, you have to multiply basic static load rating (C) and basic dynamic load rating (C_0) by contact factor shown in Table 2.

No. of blocks contacted	Contact factor (f_C)
2	0.81
3	0.72
4	0.66
5	0.61
Over 6	0.6
Common use	1.0

4) Load factor (f_w)

Generally the static load applied to the block of Linear Motion guide can be calculated by formula. But the load applied to the block while running the machine tends to come from vibration or impact. Therefore, you have to consider load factor (f_w) shown in Table 3 for the vibration or impact load during the speedy running of the machine. It can be calculated by dividing the basic dynamic load rating of Linear Motion guide by load factor (f_w).

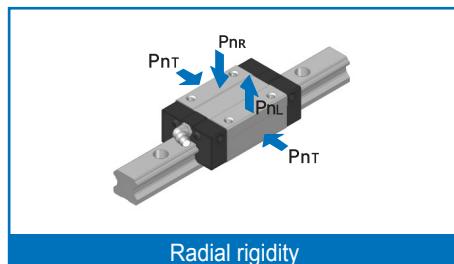

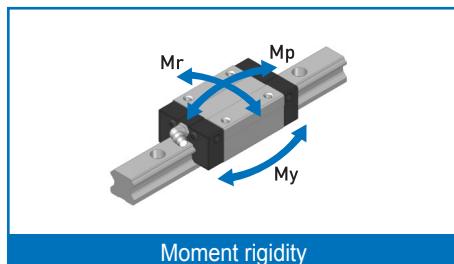

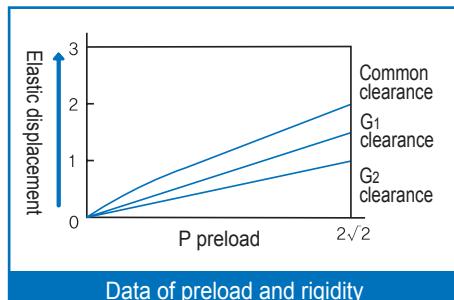

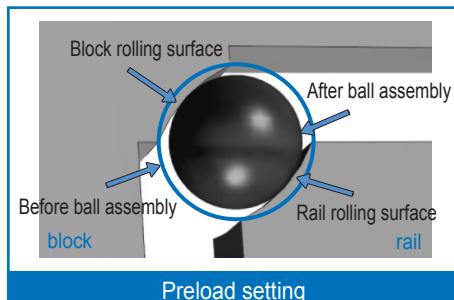

Table 3.

External condition	Service conditions	Load factor (f_w)
Low	There is no external vibration or impact due to the smooth running of machine at mild speed.	1.0 ~ 1.3
Moderate	There is moderate external vibration or impact due to the running of machine at low speed.	1.2 ~ 1.5
Big	There is strong vibration or impact due to the running of machine at fast speed.	1.5 ~ 2.0
Very big	There is strong vibration or impact due to the running of machine at very fast speed.	2.0 ~ 4.0

4 Rigidity & Preload

1. Preload

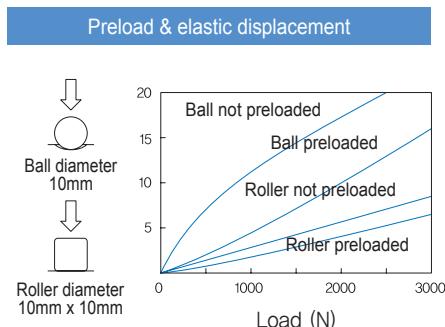

Linear Motion guide is preloaded in a way that improves mechanical precision by eliminating clearance using the rolling element (ball or roller) inserted into the space between rail and the block or in a way that applies load to the rolling element in advance by inserting the rolling element larger in size than the clearance of raceway between rail and the block. This process will enhance the rigidity of Linear Motion guide and lessen the displacement level caused by external load.

2. Radial Clearance

Radial clearance refers to the total travel distance in a radial direction from the center of the block of Linear Motion guide when mild load is applied to the block up and down from the center part of the rail length after the block is assembled in the rail which is then fixed to base.

Radial clearance is usually classified into common clearance (no symbol), G₁ clearance (light preload), G₂ clearance (heavy load), and G_s clearance (special preload), and are optional depending on usage. The values are standardized by form.

	Preload type	Preload symbol	Preload symbol
H	Moderate	No symbol	0 ~ 0.03 x C
	Light	G ₁	0.04 ~ 0.08 x C
	Heavy	G ₂	0.09 ~ 0.13 x C
S	Moderate	No symbol	0 ~ 0.03 x C
	Light	G ₁	0.03 ~ 0.05 x C
	Heavy	G ₂	0.06 ~ 0.08 x C

Table 4. Service condition for radial clearance (preload)

Type	Preload status	Symbol	Service Conditions	Use
1. Moderate	Plus-minus clearance	No (1)	·Load is applied in uniform direction and smooth running is needed. ·There is almost no vibration or impact and precise running is required.	Welding machine, textile machinery, packaging machinery, various conveyors, medical equipment, woodworking machine, glass cutting machine, take-out robots, ATC, winding machine
2. Light	Minus clearance in small amount	G ₁ (2)	·There is a little vibration or impact and moment load. ·Light load is applied, yet high precision is required.	Various industrial robots, measuring equipment, inspection equipment, 3D processor, laser processor, PCB drilling machine, various assembling machine, electric spark machine, punching press
3. Heavy	Minus clearance in large amount	G ₂ (3)	·There is mild impact load or overhang load and moment load. Rigidity and high precision are required.	CNC shelf, machining center, milling machine, grinding machine, tapping center, drilling machine, hobbing machine, various special equipment
4. Special	Minus clearance in small or large amount	G _s (4)	·With smaller clearance than that of G ₁ preload, light and precise operation is required.	No preload, ultra-light preload, larger-than-moderate preload, special preload customized to user's conditions, special processing machine for heavy-duty cutting

Note (1) No clearance or very small clearance.

(2) Very small minus clearance.

(3) Quiet large minus clearance to enhance rigidity

(4) Preload below G₁ or over G₂ to meet service conditions

Table 5. Radial clearance of H & S Series

5 Friction

1. Friction

Linear Motion guide's friction resistance occurs to the level of 1/20~1/40 compared to existing sliding guide since the rolling element (ball or roller) is assembled between the rail and the block which is the raceway surface. Also starting torque is low because the difference between static friction and kinetic friction is very small. Its low power loss and temperature rise in the part of linear motion are of advantage to speedy operation. Its high conformability and response realize the highly precise positioning.

2. Friction Coefficient

Friction resistance of Linear Motion guide relies on the load applied to Linear Motion guide, speed, lubrication or form. In case of light load or high-speedy motion, lubrication or seal is the main cause of friction resistance. In case of heavy load or slow motion, the magnitude of load affects friction resistance.

$$F = \mu P$$

F : Friction resistance
 μ : Kinetic friction factor
P : Load

(N)
(N)

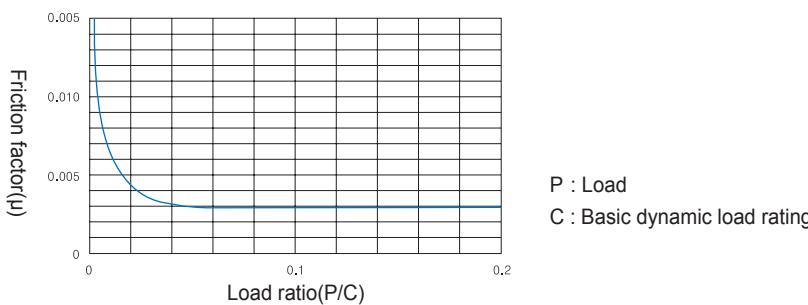

Figure 5. Relation between load ratio and friction factor

Common friction factors of various operating systems are shown in a table below and applied in case of proper lubrication or assembly and normal load.

Type of operating system	Major model number	Friction factor μ
Linear Motion Guide	H, S, M, MB	0.002 ~ 0.003
	R	0.001 ~ 0.002
Ball Spline	WLS, WSP	0.002 ~ 0.003
Super Ball Bushing / Linear Ball Bushing	SB, SBE, LM, LME	0.001 ~ 0.003
Cross Roller Guideway	WRG	0.001 ~ 0.0025

6 Precision

1. Precision Specification

The degree of travel of Linear Motion guide is measured as below. (See Figure 6)

- Tighten rail to the mounting surface of the bed using a bolt at the prescribed torque. (See Figure 6)
- Draw a measuring jig right up against the datum plane of the block as shown in Figure.
- Measure it by having the block and measuring jig travel the whole section from the starting point to the end point of the rail.
- The value measured by the measuring jig is the error in the parallelism of motion of the block.

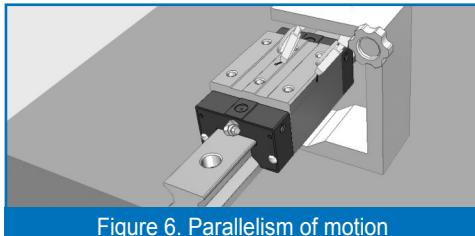

Figure 6. Parallelism of motion

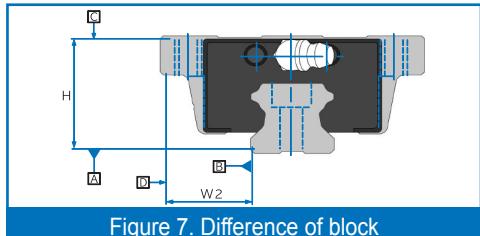

Figure 7. Difference of block

Measuring the error in the degree of parallelization between the datum plane of block and that of rail

Difference between the maximum difference and minimum difference of blocks in each height and dimension installed to surface

2. Precision Design

Table 8. Classification of precision

Dimension	Terms
Dimension tolerance of height H	Distance from the base side of rail A to the top side of block C
Difference in height H	Difference in the height of blocks combined from each rail on the same plane
Dimension tolerance of width W ₂	Distance between the datum plane of rail B and the reference side of block D
Difference in width W ₂	Difference of the reference axis of rail B and the reference side of block D of blocks combined to the rail
Parallelism of motion of C against A	Change in the top side of block C based on the base side of rail A during the motion of block combined to the rail
Parallelism of motion of D against B	Change in the reference side of block D based on the reference side of rail B during the motion of block combined to the rail

7 Lubrication

1. Purpose

The purpose of lubricating Linear Motion guide is to create an oil film between rail, the raceway surface of block and a rolling element to avoid the direct contact of metals and reduce friction and wear, preventing the raceway surface and the rolling element from being overheated and melted to be adhered to each other.

Moreover, the oil film created between the raceway surface and a ball decreases load-induced contact stress to improve the rolling contact fatigue life and prevent rust.

Linear Motion guide is equipped with seal but grease inside the block is leaking little by little during the operation. Therefore it is required to lubricate it at a time and interval appropriate to each service condition.

2. Selection of lubricant

To achieve the best performance of Linear Motion guide, you have to select the lubricant suitable for service conditions.

Lubricants used for Linear Motion guide include grease and oil. You can select the lubricant and lubrication method that fit your service conditions, load, operating speed, assembly type, etc.

3. Grease lubrication

Grease is a semisolid lubricant consisting of base oil, thickener, and additives.

In case of using grease for Linear Motion guide, lithium soap grease is commonly used, but grease mixed with extreme-pressure additive is used under high load or according to use. If you want to use Linear Motion guide in a high-vacuum environment or a clean room, it's desirable to choose grease with excellent performance in low evaporation and low dust raise.

1) Refilling of grease

To refill grease to Linear Motion guide, supply a sufficient amount of grease through the nipple until remaining grease is discharged. It is appropriate to fill grease up to 50% of the volume of the block. To reduce rolling resistance which may increase after grease is filled, it is better to take a test run about 20 times prior to the operation.

2) Refill interval

If Linear Motion guide's travel exceeds a certain time, its lubricating performance declines. So it is required to refill an appropriate amount of grease at a proper time depending on service conditions and environment. Usually grease is to be filled when the travel distance reaches 100KM.

$$T = \frac{100 \times 6000}{V_e \times 60} \text{ hr}$$

T : Oil refilling cycle (time)

V_e : Velocity (m/min)

4. Oil lubrication

In case of using oil for Linear Motion guide, it is recommended to use oil lubricant with high viscosity (68mm²/sec) under higher load while oil lubricant with low-viscosity (13mm²/sec) at high velocity.

It is appropriate to refill 0.3cm³ of oil per hour for each one block.

Table 16. Inspection and refilling time of lubricant

Type	Inspection item	Inspection period	Refilling time
Grease	<ul style="list-style-type: none"> Status of mixing with cutting chip, dust, foreign substance Status of contamination by other substances 	3~6 months	<ul style="list-style-type: none"> Generally 1-2 times per year Usually more than once per year if travel exceeds 100km/year Refill depending on the situation after checking the status of grease
Oil	Lubricant quantity, contamination, foreign substance	3~6 months	<ul style="list-style-type: none"> Refill depending on the results of inspection, and determine the optimal amount to refill depending on the capacity of oil tank
	Check oil level (supply oil mist)	Before every operation	<ul style="list-style-type: none"> Refill an appropriate amount after identifying the consumption Standardize the optimal amount after identifying the consumption

* Please do not use oil that may affect synthetic resin which is the material of Linear Motion guide units.

Table 17. Lubricants used for Linear Motion guide

Application	Main use	Product name	Manufacturer	Temp. in use (°C)	Base oil	Type of thickener
Common use (extreme-pressure additive incl.)	Industrial machine, machine tool	Albania EP2 NIGACE AFC	SHELL NTG	-20 ~ +110	Mineral oil	Lithium
Common use	Machine tool, electric spark machine, industrial robots, etc.	Albania S2 NIGACE AFC	SHELL NTG	-25 ~ +120 -54 ~ +170	Mineral oil Synthetic oil	Lithium Urea
Clean & low dust raise	Semiconductor, FPD equipment	SNG 5050 DENUM	NTG DAIKIN	-40 ~ +1200 -50 ~ +300	Synthetic oil	Urea
Eco-friendly	Semiconductor AMOLED process equipment, driving gear in vacuum chamber	FOMBLIN Krytox High vacuum grease	AUSIMONT DuPont Dow Corning	-20 ~ +250	Synthetic oil	Ethylene fluorinated
Machine tool	Excellent in preventing rust and oil film strength Suitable for machine tools because it is hardly emulsified to clearance	VACTRA No.2 SLC DTE Oil	Exxon Mobil	-20 ~ +100	Oil	Way oil Turbine oil
Specialuse	Corrosion proofing	6459 Grease	SHELL	-20 ~ +100	Mineral oil	Polyurethane

8 Surface Treatment

1. Surface Treatment

WON ST uses the following methods for the optimal treatment of surfaces of Linear Motion guide in order to prevent rust and enhance appearance.

2. Types of Surface Treatment

1) Electrolytic rust-preventive black coating (black Cr plating)

This is an industrial black chrome coating which is used to improve the corrosion resistance at low cost. It can achieve better corrosion resistance than martensite stainless steel and be used to enhance appearance and prevent the reflection of light.

2) Industrial hard Cr plating

The film's hardness is over 850HV so its wear resistance is excellent and the corrosion resistance is comparable with that of martensite stainless steel.

WON ST offers surface treatments such as alkakine coloring or color alumite treatment if a customer requests. If you want use Linear Motion Guide by treating its surface, you have to set the safety factor high.

3) Fluoride low-temperature Cr plating

It is also called "Raydent." This is a combined surface treatment of black Cr coating with special fluoride resin coating which is used in where corrosion resistance or low dust raise is needed - for instance clean room.

9 Dust Proof

1. Dust Proof

To make use of the characteristics and performance of Linear Motion guide, it is important to protect the unit from external foreign substances which are likely to cause abnormal wear or shorten life. If dust or foreign substance is expected to be mixed in, it is required to use the effective sealing or dust-proofing system.

2. Types of Dust Proof

WON Linear Motion guide is basically equipped with seal but if a customer request, a metal scraper can be additionally mounted on the unit before shipment.

1) Exclusive seal

The block is equipped with end seals, side seals and inner seals to protect the bearing from foreign substances.

2) Metal scraper

A metal scraper is installed outside the end seals and effective in preventing foreign substances such as hot spatter or slag created during a welding process from entering into the unit.

10 Measure to Use in Special Environment

WON Linear Motion guide is useful in various special applications if being used in accordance with service conditions including material, surface treatment, dust proof, grease, etc.

Table 18.

Type of lubricants	Details	Details	
Clean (clean room) - Semiconductor, FPD, medical equipment -	<ul style="list-style-type: none"> If used in a clean environment, dust or particles generated in Linear Motion guide should be minimized. 	Lubricant	<ul style="list-style-type: none"> For use in a clean environment Use low dust raise grease
		Rust prevention	<ul style="list-style-type: none"> Black Cr coating Fluoride low-temperature colorimetric Cr plating (Raydent treatment) Use high-corrosion resistant stainless steel as material
Vacuum - Semiconductor, FPD deposition equipment -	<ul style="list-style-type: none"> If used in a vacuum environment, out gas discharged from Linear Motion guide should be tightly controlled to maintain the vacuum status. Great rust prevention is required since rust-prone parts cannot be used in this environment. 	Lubricant	<ul style="list-style-type: none"> Use grease for a vacuum environment
		Rust prevention (Out Gas)	<ul style="list-style-type: none"> Use high-corrosion resistant stainless steel as material Use a self oiling agent using special coatings such as fluoroplastic coating Use ceramic as material
High- temperature environment	<ul style="list-style-type: none"> If used in higher temperature than general environment, the material's heat resistance is important and plastic synthetic resin used for parts should be replaced with metal. 	Lubricant	<ul style="list-style-type: none"> Use grease for high-temperature environments
		Material	<ul style="list-style-type: none"> Use an end seal, side seal + double seal Use a double seal Use a special seal for high temperature
Dust	<ul style="list-style-type: none"> If used in an environment filled with cutting chips, wood dust, and dust, it is required to develop a measure to protect the block from foreign substances. 	seal	<ul style="list-style-type: none"> Use a plastic synthetic resin cap Use a metal cap Use a metal scraper
		Cap	<ul style="list-style-type: none"> Use a plastic synthetic resin cap Use a metal cap Use a seal plate
		Holding door	<ul style="list-style-type: none"> Use an exclusive holding door Use an sealing all-in-one holding oor
Spatter	<ul style="list-style-type: none"> If exposed to a spot welding or arc welding environment, hot spatters may be fixed onto the 	Spatter	<ul style="list-style-type: none"> Fluoride black Cr coating
		seal	<ul style="list-style-type: none"> Use a metal scraper
		Dust proof	<ul style="list-style-type: none"> Use a metal cap Use a seal plate

11 Placement and Installation

1. Placement and Structure

To place Linear Motion guide in the equipment, first identify the overall structure of the equipment, then check the size of the base and a transfer table and consider load applied according to mounting directions such as placing vertically, in slope, or in the back as well as required life to make sure Linear Motion guide is optimally installed.

Placement of Linear Motion guide (example)

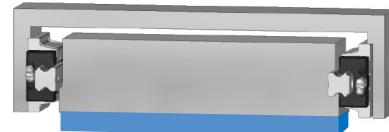

(1) Assembly of the top side of block, block transfer

(2) Assembly of the back side of block, rail transfer

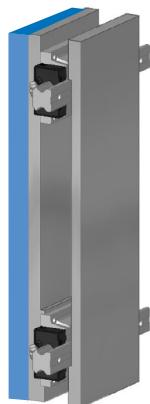

(3) Assembly of the flank of block, block transfer

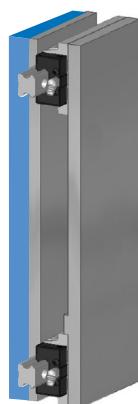

(4) Assembly of the flank of block, rail transfer

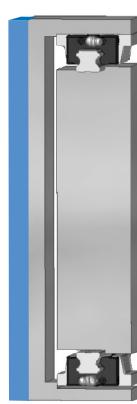

(5) Assembly of the wall side of block, rail transfer

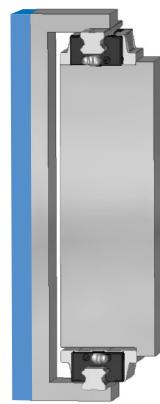

(6) Assembly of the wall side of block, block transfer

(7) Symmetrical assembly of the top and bottom of block, rail transfer

(8) Symmetrical assembly of the top and bottom of block, block transfer

2. Mounting and Fixation

In the structure that vibration or impact is applied or where combined load or moment load is applied, Linear Motion guide should be fixed in a different way from a general method.

As a widely used method, push a pressure plate from the flank after slightly protruding the block and rail of LM unit.

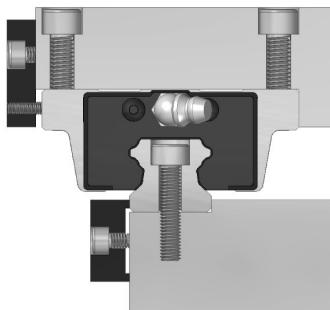

Figure 8. Pushing a pressure plate from the flank

Fasten a tapered fixture with a bolt. Even slight bolting up generates big force in a horizontal direction. If it is bolted up too much, deformation may occur in rail, for instance, which needs to be taken a caution.

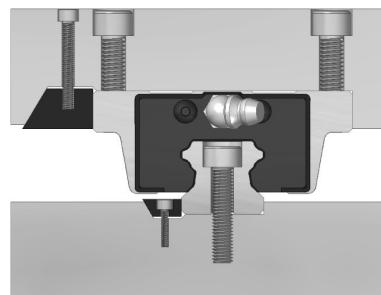

Figure 9. Pushing a tapered plate

Need to use miniature bolts due to space constraint when pushing the rail and useful if having many bolts for pushing.

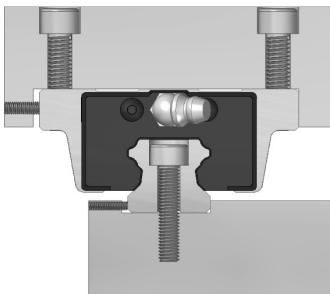

Figure 10. Pushing a bolt from the flank

Push a needle roller with the head of a countersunk screw using a roller of the bed. You must be careful to push it to fit the screw.

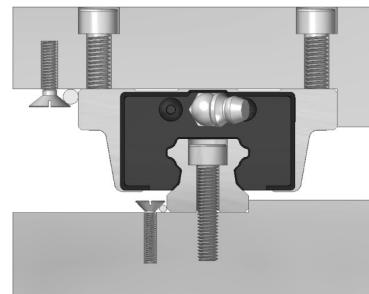

Figure 11. Pushing a roller

3. Design of mounting surface during installation

Design and management of mounting surface

The precision of mounting surface of Linear Motion guide and the error in installation generate unexpected load and stress to the unit, therefore it is required to take caution to prevent the harmful effects on the unit's travel and life.

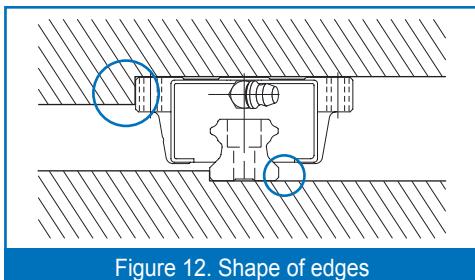

Figure 12. Shape of edges

Management of vertical angle of datum plane for installation

If the vertical angle of the installation surface and of a rail or a block is inaccurate, it cannot be assembled precisely. So you need to review the vertical angle and error during design.

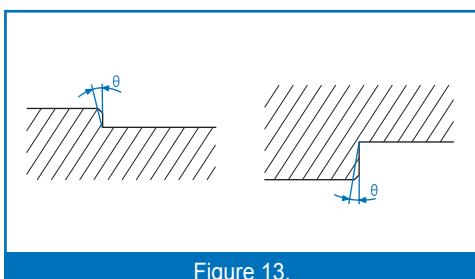

Figure 13.

Management of datum plane for assembly

It is important to manage the height and thickness of datum plane during design.

If the height is too high or low, a rail or a block cannot be assembled precisely due to its surface attachment. Or the application of eccentric load, horizontal load and moment load may loosen the strength of joint and result in faulty assembly which will be unable to meet the precision requirements. So attention must be paid

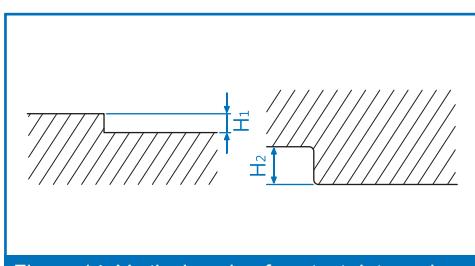

Figure 14. Vertical angle of contact datum plane

Management of the shape of contact corner

If the right-angled corner of a rail or a block installed to the mounting surface of Linear Motion guide is processed in R-shape and R value is bigger than the dimension of the surface of the rail or the block, it may not be assembled precisely to the datum plane. So attention must be paid.

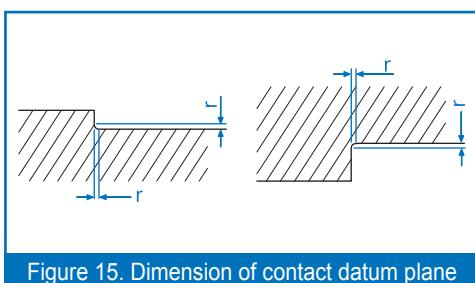

Figure 15. Dimension of contact datum plane

Management of dimensional tolerance between datum plane and bolt during design

If the dimensional tolerance from the contact datum plane to the mounting hole of a rail or a block of Linear Motion guide is too big, precise assembly is impossible so attention must be paid.

Generally the dimensional tolerance is $\pm 0.1\text{mm}$.

If the distance tolerance from the assembly datum plane to the assembly bolt roll of a rail and a block is too wide or narrow, precise assembly is impossible. So the tolerance must be $W3 \pm 0.1\text{mm}$ during design.

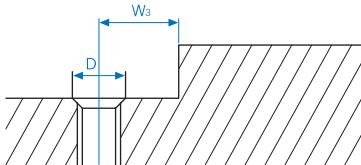

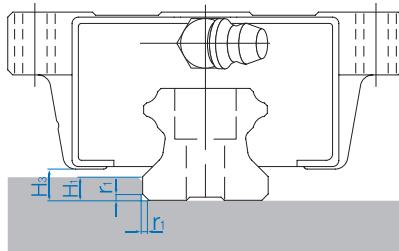

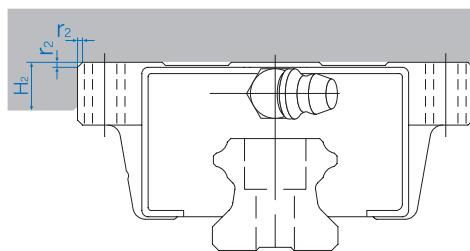

Figure 16. Dimensional tolerance between contact datum plane and mounting hole

Assembly of rail datum plane

Assembly of block datum plane

Figure 17. Height of the raised spot of mounting surface and radius of corner R

- Make a datum plane which can contact the flank in order to secure convenience in assembly of and precision positioning of a rail and a block during the installation of Linear Motion guide.
- The height of the raised spot of contact datum plane or the radius of corner may vary depending on the specifications of Linear Motion guide so please see the table below.
- To prevent deformation of the raised spot by pressing force from above or pushing force from side, sufficient thickness must be secured during design.

55	1.5	1.5	8	10	10

4. Error tolerance of mounting surface during installation

1) Auto-adjusting and error-absorbing abilities

Linear Motion guide has an excellent auto-adjusting ability so that even though the structure to be assembled to a rail is slightly deformed or processing error may occur, the straightness or parallelism of a table after assembly will be better than the precision in processing before assembly and the quite straight-line running is available.

2) Error tolerance of the degree of parallelization when using 2-axis assembly (P_1)

The error in the degree of parallelization when using a 2-axis assembly is as shown below.

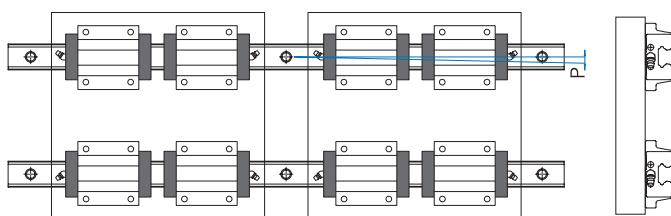

Figure 18. Error tolerance of the degree of parallelization (P_1)

The error tolerance of height level in using 2-axis Linear Motion guides is as follows.

5. Marking of datum plane during installation

The datum plane of WON ST's Linear Motion guide is the ground surface on the opposite side of WON mark shown in the block.

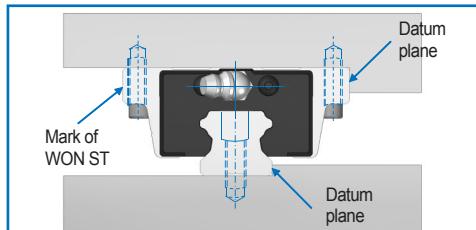

Figure 20. Linear Motion guide on the reference axis

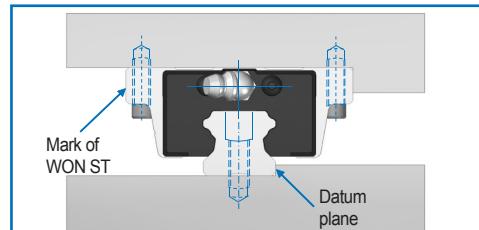

Figure 21. Linear Motion guide on the driven shaft

6. Connection of rails

If you need a longer rail than the one supplied, you can connect rails for the purpose of use. The mark on the rail indicates the point where rails should be linked.

If the block passes through the connecting points simultaneously, they may affect the unit's travel and cause a delicate hitch. To solve this problem, it is recommended to make sure the connecting points intercrossed

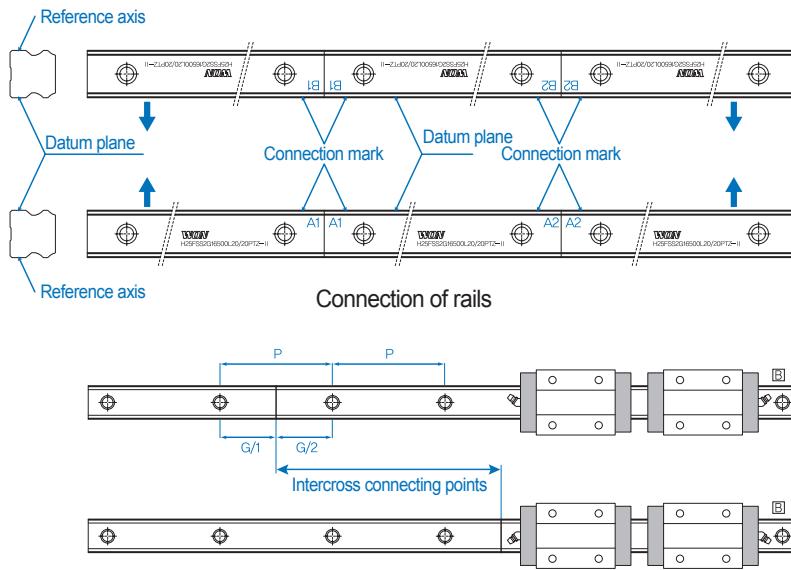

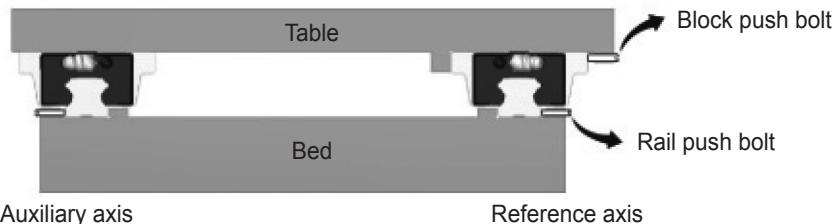

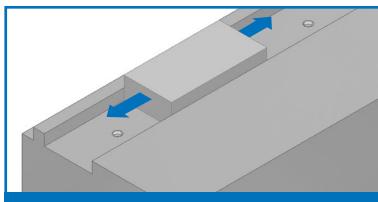

Figure 22. Connection of rails

7. Installation of Linear Motion Guide

1. Installation of Linear Motion guide in the equipment exposed to vibration and impact

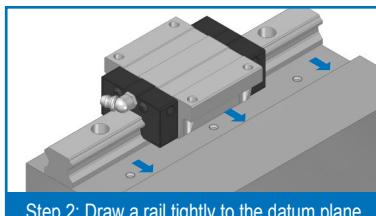

1) Install a rail

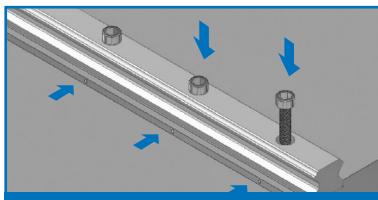

Step 1: Check the surface to be installed with a rail

Prior to installation, thoroughly remove burr, dust, rust preventive oil, etc.

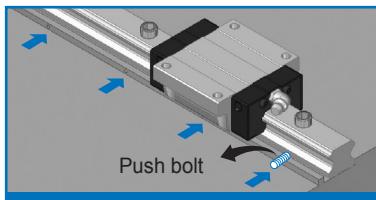

Step 2: Draw a rail tightly to the datum plane

Gently place LM guide on the bed and push it in the opposite direction of the bed's datum plane

Step 3: Fasten bolts temporarily

Check the status of bolts and fasten every bolt temporarily

Step 4: Fasten push bolts

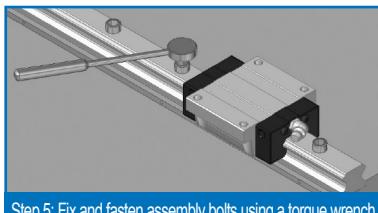

Fix push bolts to make sure that the rail is parallel with the datum plane of the bed.

· Step 5 :

Fasten all bolts using the recommended torque. Fasten the bolt in the center first and then continue fastening each bolt toward both ends in order to maintain the precision of rail during assembly.

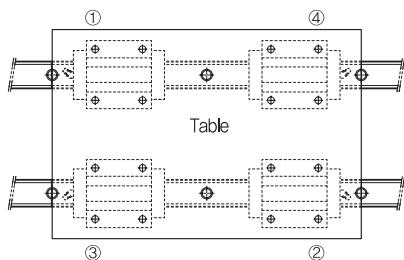

· Step 6 : Assemble an auxiliary axis

Repeat the procedure above for the installation of an auxiliary axis.

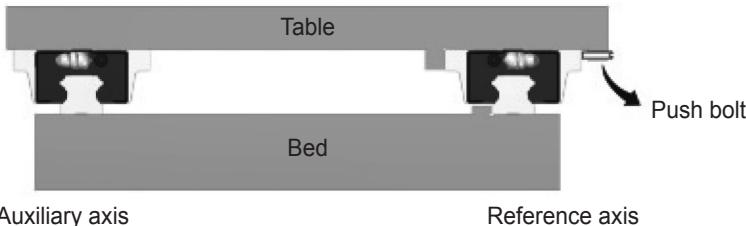

Step 5: Fix and fasten assembly bolts using a torque wrench

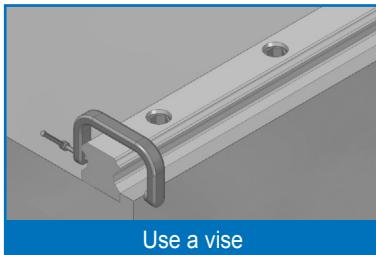

2) Install a block

2. Installation of Linear Motion guide without a push bolt

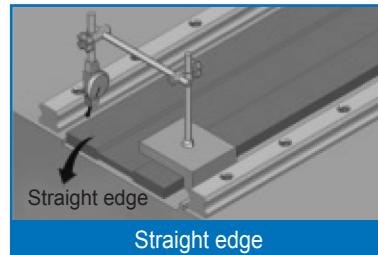

1) Install a master rail

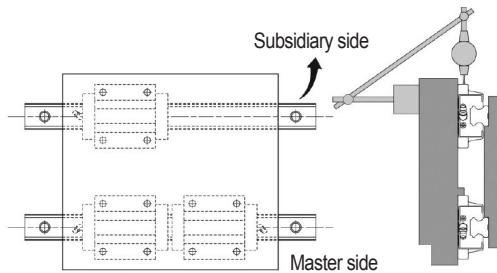

Fasten bolts temporarily and push a master rail toward the datum plane using a C-vise. Fasten the bolts according to the prescribed torque and order.

2) Install an auxiliary rail

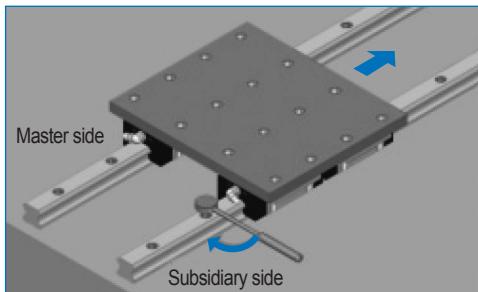

Place a straight edge between two rails and make sure it is parallel with the master rail that is fixed temporarily.

Check the degree of parallelism with the dial gauge and adjust the rail if needed. Then, fasten bolts in order.

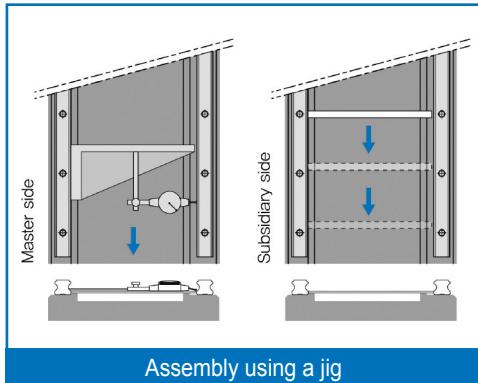

- Assembly using a table

1. Fix two blocks on the datum plane and one block on the subsidiary side to a table.
2. Fix another auxiliary block and rail to the table and bed temporarily.
3. Place a dial gauge on the table and make sure a prober of the gauge contact the subsidiary side of the block.
4. Separate the table from the end of the rail and check the degree of parallelization of the block with the auxiliary rail.
5. Fasten bolts in order.

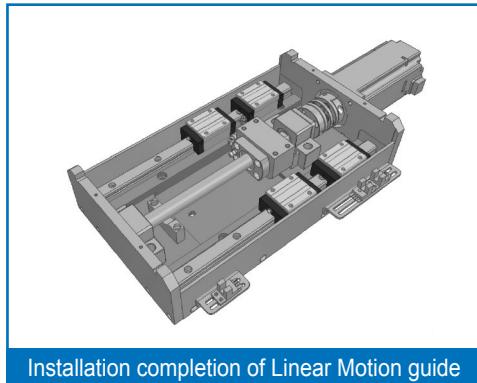

- Assembly using a rail on the datum plane

1. Fix two blocks on the datum plane and one block on the subsidiary side to a table.
2. Fix another auxiliary block and rail to the table and bed temporarily.
3. Separate the table from one rail and make an adjustment by considering the rolling resistance during the movement and checking the degree of parallelization of the auxiliary rail.
4. Fasten bolts in order.

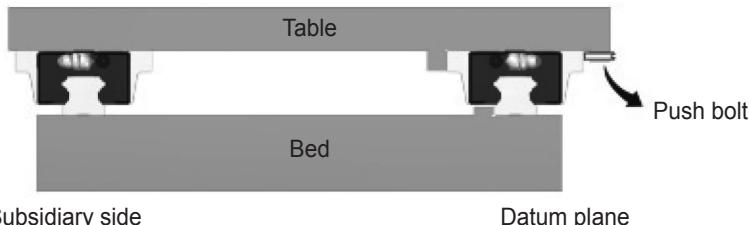

Assembly using a jig

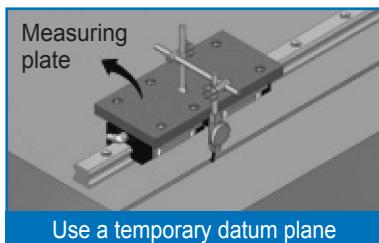

Installation completion of Linear Motion guide

Move the position of a block in every bolt pitch at the end of the rail in consecutive order and fasten bolts in order by adjusting the degree of parallelism between the datum plane of a reference rail and that of an auxiliary rail using a special jig.

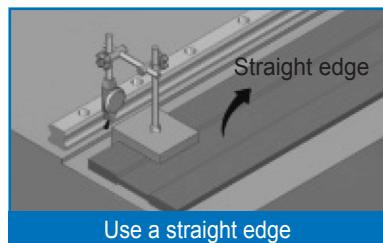

3. Installation of Linear Motion guide without the datum plane for a reference rail

1) Install a reference rail

Fix two blocks together onto the measuring plate and install the temporary datum plane near the surface where a rail is to be installed on the bed. Then check and adjust the degree of parallelism of the rail and fasten bolts in order.

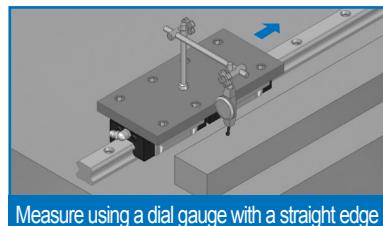

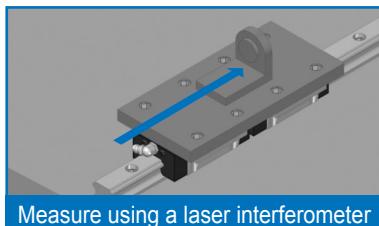

Fix a rail to the bed temporarily and adjust it to be straight using a dial gauge and then fasten bolts in order.

2) Apply the same method when installing the auxiliary block and rail

4. Measure precision after installation

You can check the precision of travel by fixing two blocks onto the measuring plate. Use a dial gauge with a straight edge or a laser interferometer to measure the precision.

In case of using a dial gauge, you have to place the straight edge as close to the block as possible in order to accurately measure it.

8. Torque used to fasten bolts during the assembly of Linear Motion guide

1) Select the optimal torque for bolts

For the assembly of the rail of Linear Motion guide, the optimal clamping torque must be used depending on the materials of mounting surface or bolts. Inaccurate clamping torque may affect the mounting precision of the rail so please use a torque wrench.

2) Recommended torques by the material of mounting base of Linear Motion guide

Unit : N·m

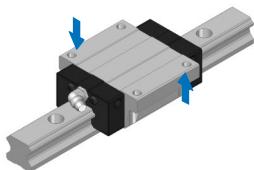

Bolt specification	Torque value (Unit : N·m)		
	Steel	Casting	Aluminum

9. Directions of bolt fastening by Linear Motion guide type

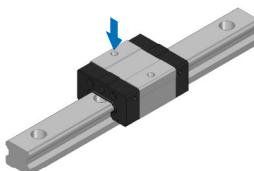

H-F, H-FL

Since the flange of a block is tapped and the counter bore is processed in the bottom, bolts can be assembled both from bottom to top and from top to bottom as indicated by arrows. But, if bolts are fastened from bottom to top, it is recommended to use one size smaller bolts.

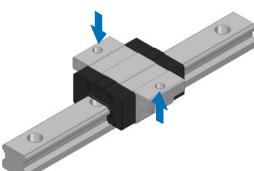

H-R, H-RL

Since tap is processed in the square body of the block, it is used when bolts are fastened from top to bottom as indicated by arrows.

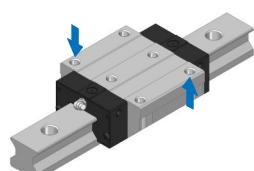

S-C, S-R

Since tap is processed in the rectangular body of the block, it is used when bolts are fastened from top to bottom as indicated by arrows.

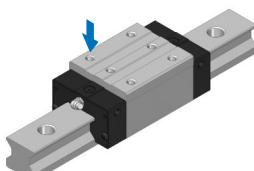

S-CF, S-F

Since the flange of a block is tapped and the counter bore is processed in the bottom, bolts can be assembled both from bottom to top and from top to bottom as indicated by arrows. But, if bolts are fastened from bottom to top, it is recommended to use one size smaller bolts.

R-F, R-FL

Since the flange of a block is tapped and the counter bore is processed in the bottom, bolts can be assembled both from bottom to top and from top to bottom as indicated by arrows. But, if bolts are fastened from bottom to top, it is recommended to use one size smaller bolts.

R-R, R-RL

Since the rectangular body of a block is tapped, it is used when bolts are fastened from top to bottom as indicated by arrows

12 Types of Linear Motion Guide

1. Linear Motion Guide H Series

1) Structure of H Series

WON Linear Motion Guide H Series has a four-row circular arc-groove structure in the raceway groove of a rail or a block and is a 4-direction equal load type which can bear equal load rating for vertical compression load, tensile load, and horizontal load as the rolling element is combined with balls at 45 degree, which reduces friction resistance to ensure smooth motion and long life.

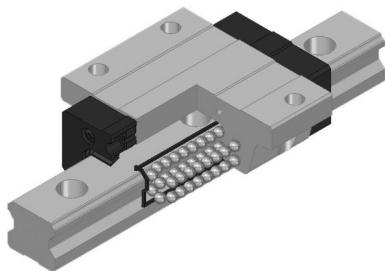

Also if the ball is preloaded, it can enhance the rigidity of Linear Motion guide and minimize Linear Motion guide's displacement for external load.

2) Features of H Series

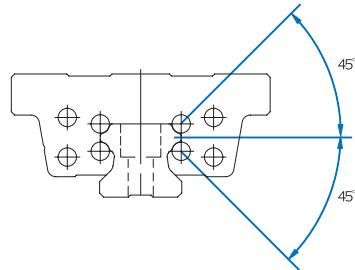

- a. High quality and very effective in realizing high precision and elimination of labor
- b. High rigidity and high precision which can realize the stable travel for a longtime
- c. Great wear resistance and friction resistance which ensures a long life
- d. Great auto-adjusting and error-absorbing abilities with the face-to-face duplex structure same to D/F combination of ball bearing
- e. Various specifications for easy design
- f. Easy to use due to great compatibility between a rail and a block

3. Slim Linear Motion Guide S Series

1) Structure of S Series

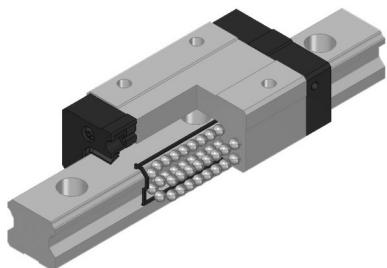

Linear Motion Guide S Series has a four-row circular arc-groove structure and is a 4-direction equal load type. It also has an auto-adjusting face-to-face D/F structure. It uses balls as a rolling element and is a slim-type guide with a low sectional height as well as high rigidity and less noise.

2) Features of S Series

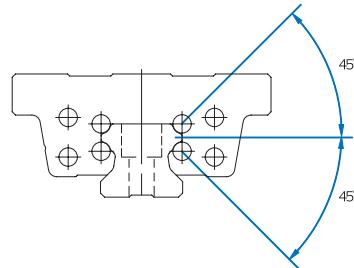

- a. High quality and very effective in realizing high precision and elimination of labor
- b. High rigidity and high precision which can realize the stable travel for a long time
- c. Great wear resistance and friction resistance which ensures a long life
- d. Great auto-adjusting and error-absorbing abilities with the face-to-face duplex structure same to D/F combination of ball bearing
- e. Various specifications for easy design
- f. Easy to use due to great compatibility between a rail and a block
- g. 4-direction equal load and high-rigidity structure
- h. Slim shape suitable for horizontal motion to ensure stable running

5. Miniature Linear Motion Guide M Series

1) Structure of M Series

WON Miniature Linear Motion Guide M Series has a shape of a gothic-arch groove in the raceway between a rail and a block and a 4-direction equal type structure with 2-row 4-point contact balls at 45 degree. Even though it is small in size, it provides stable travel and rigidity under the environment where variable load and combined load is applied.

2) Features of M Series

- a. A compact highly-rigid 4-direction equal load type
- b. Various specifications for easy design with space and load rating taken into account
- c. Balls are maintained during the assembly of a block and a rail since a wire to retain balls is built in the block.
- d. Its material is stainless steel which does not rust easily, so it is very suitable for the environment where rust and particle generation should be prevented - clean room, for instance.

6. Wide Miniature Linear Motion Guide MB Series

1) Structure of MB Series

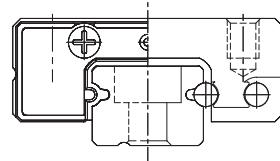

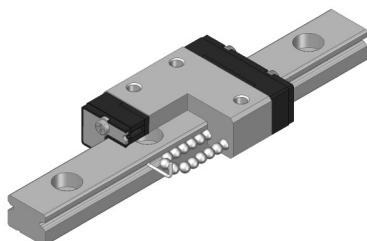

WON Miniature Linear Motion Guide MB Series has a 4-direction equal load type which is identical to M Series, and the basic load rating and moment load are significantly improved compared to the general M Series by broadening the width between a rail and a block.

2) Features of MB Series

- a. As the width between a rail and a block is broadened and the number of balls increased, load rating and moment load are improved.
- b. Suitable for use in a one-axis type since it is wider than the general miniature Linear Motion guide and rigidity increased.
- e. A compact highly-rigid 4-direction equal load type
- f. Various specifications for easy design with space and load rating taken into account
- g. Balls are maintained during the assembly of a block and a rail since a wire to retain balls is built in the block.
- h. Its material is stainless steel which does not rust easily so it is very suitable for the environment where rust and particle generation should be prevented for clean room, for instance.

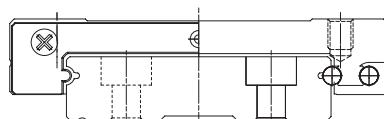

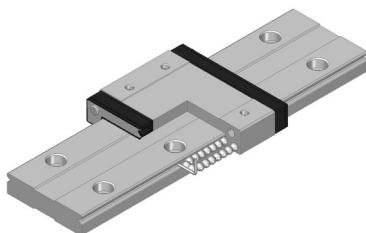

For MB12 and MB15 Model Numbers, Bearing Steel material (MBT12, MBT15) is ready to produce.

7. Roller Linear Motion Guide R Series

1) Structure of R Series

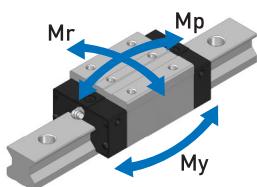

WON Linear Motion Guide R Series uses rollers as a rolling element between the raceway surface of a rail and a block and its four-row cylindrical roller forms a contact angle of 45° which bears equal load for vertical tensile compression load and horizontal load.

A roller used as a rolling element has less elastic displacement than a ball so it has small displacement for external load. Also the contact area with the roller is wide so that it has advantages such as high rigidity, bearing against big load, long life, impact resistance and wear resistance as well as less friction resistance that supports smooth motion and quiet running.

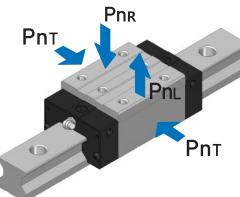

Moreover if the roller is preloaded, it can enhance the rigidity of Linear Motion guide.

2) Features of R Series

- High quality and very effective in realizing high precision and elimination of labor
- High rigidity and high precision which can realize the stable travel for a long time
- Great wear resistance and friction resistance which ensures a long life
- High rigidity and overload capacity compared to ball types of the same model no.
- Excellent vibration resistance since it has less displacement against impact load or variable load than ball types and vibration decay time is shorter compared to natural frequency.
- Bigger basic static load rating than ball-type Linear Motion guide with the same specifications allows the compact design using smaller model no. than ball types. If same model no. is used, it achieves longer life due to bigger load rating.
- Various specification for easy design

SS	O	-	-
ZZ	O	-	O

2. Oil Filler

Fuelling on the side and top is available in R Series. The standard specification does not include the oil filler that penetrates the block of Linear Motion guide to protect it from foreign substance. Therefore, if you have a request, please contact WON ST.

Unit : mm

5. How to install Linear Motion guide using a support rail

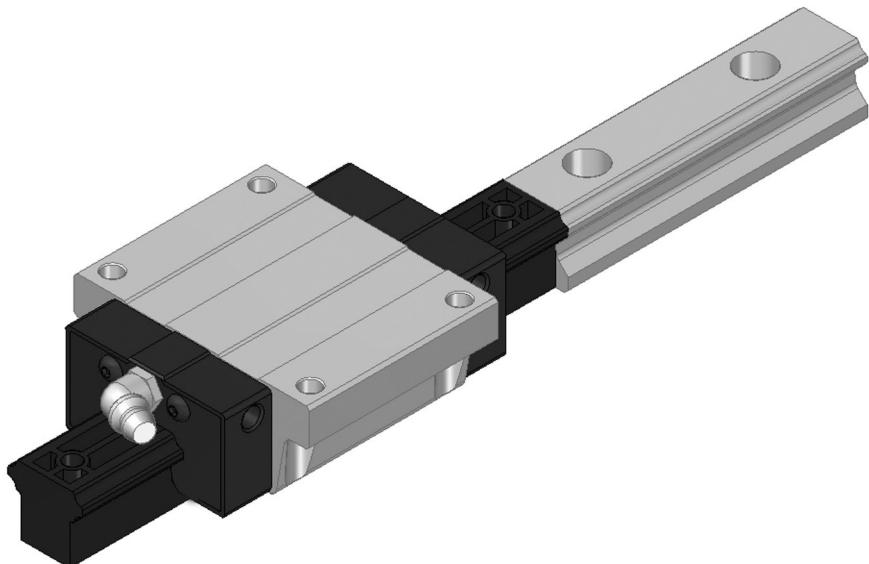

Linear Motion guide block should be inserted into or removed from the rail using a support rail for safety.

If you install the block in the rail without using the support rail, a rolling element may deviate from the block and damage or destroy the parts inside.

If the block without a rolling element is installed, it may significantly shorten the block's life and lead to load reduction and early breakage.

If you use the support rail, do not lean it. Adhere it to the end of the rail and slowly apply force to assemble it.

If the block is contaminated by dust as the rolling element is deviated from it, please do not use the product and contact WON ST for advice.

14 Instructions for Handling

1. Handling

- 1) The packaged WON Linear Motion guide is damp-proof after grease removal and cleaning, so please open it just before use.
- 2) The rail-block compatible product is fitted with a plastic support rail. Please take caution when assembling it with the rail.
- 3) If you reassemble a block-rail set product or a single block product after dismantling it into pieces, foreign substance may intrude into the block, decreasing performance to make rolling motion unsmooth or damaged. So please do not disassemble it.
- 4) If either a rail or a block leans to one side, the block or the rail may fall to be damaged. Please take caution and avoid the deviation of the block or the rail.
- 5) The end plate may be damaged if impact is applied since it is made of plastic material. Please be careful.

2. Lubrication

- 1) If the product is supplied as it is applied by rust preventive oil, please clean it off thoroughly and fill lubricant prior to use.
- 2) Do not mix it with other lubricants such as thickener or additive. If so, it may destroy the structure of grease or cause a harmful effect.
- 3) Viscosity of grease may vary depending on temperature and increase in winter due to low temperature, and the friction resistance of Linear Motion guide may increase.
- 4) In case of using special lubricant, please contact WON in advance.
- 5) In case of using oil lubricant, it may not reach the hole of raceway depending on the assembly status or direction of a block and a rail, so no lubricating effect may be obtained. WON can offer the lubricating method suitable for each assembly environment so please contact WON.

3. Caution for Use

- 1) After opening the product, please put damp-proof agent inside the dry container for storage.
- 2) Please handle the product after wearing plastic gloves in a clean place.
- 3) Please be careful to protect it from foreign substance which may inhibit rolling motion or damage function.
- 4) Please protect it using a holding door or cover to prevent Linear Motion guide exposed directly to poor environment that may cause corrosion or damage.
- 5) In case of using standard plastic end plate-based Linear Motion guide, use it at under 80°C. To use it at higher temperature than 80°C, please order a metal end plate which will specially customized.
- 6) If the rail of Linear Motion guide is fixed at the ceiling or in high place and if the block bears load downwards, the end plate may be destroyed or a ball may come off from the rail resulting in the fall of the block and fixtures. So please take a measure to install a safety device.

4. Storage

Depending on storage conditions, a rail may warp. For storage, place it in a horizontal position in the package box provided by WON or in a similar box with the flat bottom and avoid the environments where temperature is too high or low and very humid.

Cause and Countermeasure of Damage of Linear Motion Guide

Condition		Cause	Countermeasures
Fatigue failure on the rolling surface	<ul style="list-style-type: none"> ▪ Flaking <ul style="list-style-type: none"> - Caused by rolling fatigue on the rolling surface - Maximum shear stress-induced internal cracks are expressed on the surface. 	Damage by life	Change Linear Motion guide
		Overload	Reconsider the model no. selected, use higher model no., lower the load level, reinforce the assembly precision during installation, enhance the rigidity of base and table
		Poor lubrication	Refill lubricant, shorten the refilling interval of lubricant, review the relevance of lubricant in use, improve the lubricant passage
Indentation of the rolling surface	<ul style="list-style-type: none"> ▪ Indentation <ul style="list-style-type: none"> - Plastic deformation on the rolling surface due to excessive external load 	Impact load or excessive external load	Reconsider the model no. selected, lower the load level, reinforce the assembly precision during installation, use the higher model no.
		Careless handling	Prevent impact and fall during handling Improve handling method and environment
Seizing	<ul style="list-style-type: none"> ▪ Burn <ul style="list-style-type: none"> - Rough surface of the rolling surface due to slight burning by friction between a rolling element and the rolling surface - Cause for the discoloration of the rolling surface, weakened hardness, and flaking 	Poor lubrication	Refill lubricant, use the optimal lubricant, improve the lubrication method
		Overload	Review the service conditions, lower the load level, use the higher model no. enhance the assembly precision during installation
Cracking	<ul style="list-style-type: none"> ▪ Cracking <ul style="list-style-type: none"> - Partial breaking into pieces of a rolling element or rolling surface due to excessive external load 	Impact load or excessive external load	Reconsider the model no. selected, use the higher model no. lower the load level, enhance the assembly precision during installation
		Poor raceway circulation of a rolling element	Prevent the intrusion of foreign substance, develop a dust proof measure, refill lubricant, shorten the refilling interval of lubricant, improve the lubrication method
Abnormal wear	<ul style="list-style-type: none"> ▪ Abnormal wear <ul style="list-style-type: none"> - Rapid increase in wear as the slippery between a rolling element and the rolling surface - Cause for failure in precision and preload as accompanied by oxidation wear 	Excessive load or excessive eccentric load	Reconsider the model no. selected, use the higher model no., lower the load level, enhance the assembly precision during installation
		Foreign substance	Complement the performance of seal, develop a dust proof measure
		Load	Refill lubricant, use the optimal lubricant, improve the lubrication method, improve the lubricant passage
Flatting corrosion	<ul style="list-style-type: none"> ▪ Vibration <ul style="list-style-type: none"> - Wear facilitated by the loss of oil film during the running of vibrant stroke and the slippery between a rolling element and the rolling element 	Vibration	Review the service conditions, use the higher model no., enhance the assembly precision during installation
		Foreign substance	Improve the transport condition, change lubricant, improve the lubrication method, shorten the refilling interval of lubricant
		Load	Complement the performance of seal, develop a dust proof measure
Rust prevention	<ul style="list-style-type: none"> ▪ Rust <ul style="list-style-type: none"> - Caused by the loss of oil film or contact of exposed part to water, acid, alkali and especially when cooling water enters into the block; cause for early flaking due to concentrated stress 	Intrusion of cooling water	Make a rust-preventive treatment onto the surface, complement the performance of seal, change lubricant, change cooling agent, refill lubricant, shorten the refilling interval of lubricant
		High humidity	Make a rust-preventive treatment onto the surface, improve environment
		Poor handling	Improve the condition of storage, reinforce the sealing performance, apply sufficient amount of rust-preventive oil

1 Structure and characteristic of Crossed Roller Bearing

1. Structure

WON Crossed Roller Bearing has the structure having rolling surface with V-grooved inner & outer ring which is crossed with roller and a spacer-type retainer between rollers reduces the friction between rollers so as to prevent rotational torque from increasing. It's a compact type for convenient use.

2. Characteristics

As roller is assembled to rolling surface of inner & outer ring of Crossed Roller Bearing, it reduces the elastic displacement by external load and accommodates the complex load including radial load, axial load and moment load and using spacer retainer avoids uneven wear by roller on inclined surface or uneven contact as well as hitching but helps rolling smoothly and it's a high precision and high stiffness type which allows pre-load depending surrounding environment.

3. Use

It's optimal to the use requiring complex load and high stiffness.

The uses are industrial robot, machine tool index table, ATC, medical equipment, precise alignment stage, semiconductor manufacture equipment, DD motor and others

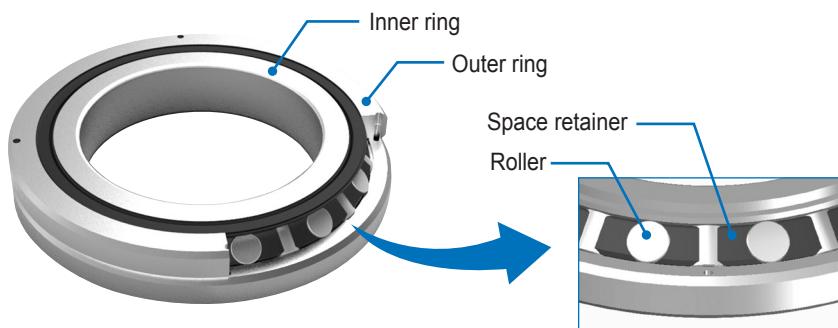

Fig 1. Structure of Crossed Roller Bearing

2 Kind of Crossed Roller Bearing

1. CB series of revolving inner ring.

- 1) Inner ring of Crossed Roller Bearing is integral type while outer ring is separable to upper and lower part which is bolted for easy handling
- 2) It's used for the part requiring inner ring rotating such as index table of machine tool or joint or turning part of industrial robot

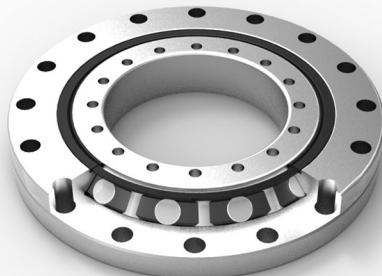

2. High stiffness CH series

- 1) Inner & outer ring are integral, high precision and high stiffness type with less installation error which leads to stable running accuracy
- 2) It's used for the part requiring inner & outer ring rotating simultaneously or independently

3. CS series for customized special type

- 1) It's customized to meet customer's own requirements in shape, dimension and material of inner & outer ring and bolt dimension.

3 Selection of Crossed Roller Bearing

1. Selection summary

After identifying the requirements specifically, the priority shall be determined considering the needs and then the optimal type shall be selected

2. Selection sequence

1 Determination of the needs

Equipment to be used, requirements, environment, precision, stiffness, service life and others

2 Selection of the type

Integral type, separable inner ring, separable outer ring, normal, high stiffness

3 Load calculation

Supporting load including radial load, axial load, moment load and dynamic equivalent load

4 Calculation of rating service life

Calculation of rating service life

5 Calculation of static safety factor

Static safety factor considering equipment characteristic and external load

6 Determination of stiffness and pre-load

Determination of clearance and pre-load considering kinetic condition and rotation accuracy

7 Accuracy level

Determination of accuracy level considering rotation accuracy and assembly accuracy

8 Determination of lubrication

Determination of lubrication such as oil, grease or special lubricant

9

Final determination

4 Nominal numbering

Numbering system of Crossed Roller Bearing manufactured by WON comprises of model, inner/outer ring size, seal, preload and grade symbol. See the following example for details.

CB5013	UU	G2	P5	SP
Part No.	seal	preload	accuracy grade	
Seal		Preload		Accuracy grade
No symbol : no seal	G1 : normal preload	No symbol : normal		
UU : seal at both sides	G2 : light load	P6 : High		
U : seal at one side	G3 : heavy load	P5 : accurate		
		P4 : highly accurate		
		P2 : Extremely accurate		

5 Calculation of service life

1. Rated service life

You can calculate the rated service life of Crossed Roller Bearing by using the formula below.

$$L = \left(\frac{f_T \cdot C}{f_w \cdot P_c} \right)^{\frac{10}{3}} \times 10^6$$

service life time

$$L_h = \frac{L}{60 \times N}$$

L : rated service life

C : basic dynamic rated load(N)

Pc : dynamic equivalent radial load (N)

f_T : temperature factor

f_w : load factor

L_h : service life time(h)

N : rpm

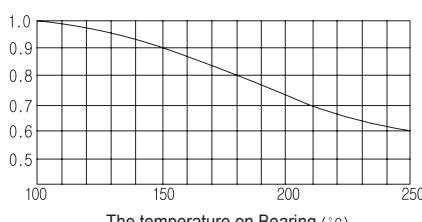

Fig 2. Temperature factor

* Note : workable temperature is 80°C or below When the temperature is more than above, please contact WON ST

2. Calculation of service life under heaving operation condition

Bearing service life under heaving condition is calculated as follows;

L_{loc} : rated service life 10^6 cycle indicated in bearing
heaving frequency under heaving operation

$$L_{\text{loc}} = \frac{90}{\theta} \left(\frac{C}{P_c} \right)^P$$

θ : heaving angle (see Fig)

P_c : dynamic equivalent radial load

※ when θ is small, oil film can hardly be formed on contact surface between orbital plane and rotating body so it may cause corrosion

In case of heaving operation

Service life time

$$L_h = \frac{360 \times L}{2 \times \theta \times n_o \times 60}$$

L_h : service life time (h)

θ : heaving angle (seg)

(※ see Fig on right)

n_o : number of reciprocating motion (min^{-1})

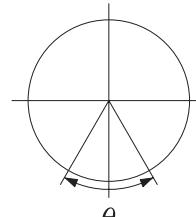

Fig 3.

3. Static safety factor(f_s)

Static safety factor of Crossed Roller Bearing is calculated as follows.

Please see Table 1 for static safety factor in general

$$f_s = \frac{C_0}{P_0}$$

f_s : static safety factor

C_0 : basic static rated load (N)

P_0 : static equivalent radial load (maximum load) (N)

Table 1 static safety factor (f_s)

Working condition	f_s Lower bound
Requires high running accuracy	≥ 3
When using under normal operation condition	≥ 2
Few rotation under normal operation condition and smooth operation is less important	≥ 1

4. Static equivalent load (P_0)

Static equivalent load of Crossed Roller Bearing is calculated as follows

$$P_0 = F_r + \frac{2M}{D_{PW}} + 0.44 F_a$$

P_0 : Static equivalent radial load (N)

F_r : Radial load (N)

F_a : Axial load (N)

M : Moment (N·mm)

D_{PW} : Roller set pitch diameter ($D_{PW} \doteq \frac{d+D}{2}$)

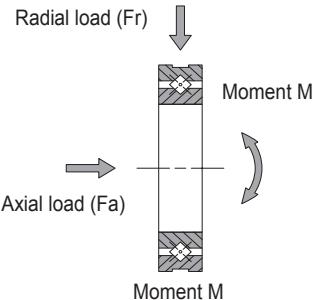

Fig 4. Bearing load

5. Dynamic equivalent radial load (P_c)

Dynamic equivalent radial load of Crossed Roller Bearing is calculated using following equation

$$P_c = X(F_r + \frac{2M}{D_{PW}}) + YF_a$$

P_c : Dynamic equivalent radial load (N)

F_r : Radial load (N)

F_a : Axial load (N)

M : Moment (N·mm)

X : Radial load factor (see Table 2)

Y : Axial load factor (see Table 2)

D_{PW} : Roller set pitch diameter ($D_{PW} \doteq \frac{d+D}{2}$)

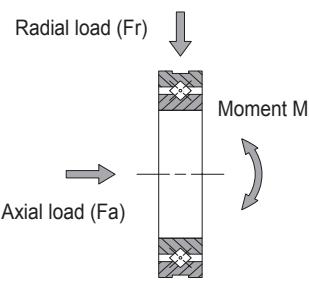

Fig 5.

Table 2. Radial load factor and axial load factor

Classification	X	Y
$\frac{F_a}{F_r + 2M/D_{PW}} \leq 1.5$	1	0.45
$\frac{F_a}{F_r + 2M/D_{PW}} > 1.5$	0.67	0.67

6. Load factor (f_w)

When using Crossed Roller Bearing, the load imposed on bearing by vibration and impact during operation is often greater than calculated load. Thus flowing load factors need to be considered when selecting the bearing.

Table 3. Load factor(f_w)

$$F = F_c \cdot f_w$$

F : bearing load (N)

F_c : theoretical load factor (N)

f_w : load factor

Load condition	f_w
Smooth condition without impact	1 ~ 1.2
Normal condition	1.2 ~ 1.5
Vibration and impact load together during operation	1.5 ~ 3

6 Static load

1. Basic dynamic rated load (C)

It refers to radial load with a constant size and direction which is able to rotate a million times with more than 90% proved no flaking occurred due to rolling fatigue when driving a bearing group comprising a number of same crossed roller bearing

2. Basic static rated load (C_0)

It refers to the static radial load which imposes a certain level of contact stress on center of contact part of revolving body and orbital plane exposed to maximum load

7 Permissible rpm

Please see the following table for permissible rpm

But permissible rpm may vary depending on assembly and working condition

Table 4. Permissible rpm of Crossed Roller Bearing ($d_m n$)

Bearing	Classification	Seal	Grease	Oil
Bearing	No seal	75,000	150,000	-
Spacer retainer	Both seals	60,000	-	-

$$\ast d_m n = d_m \times n$$

d_m : mean value of bearing inner and outer ring (mm)

n : rpm

8 Lubrication

Grease lubrication is commonly used for Crossed Roller Bearing and lubricant is injected through oil inlet. Albanian EP2 grease is filled

Bearing without lubricant shall be filled with grease or oil prior to starting operation, otherwise, wearing is accelerated and service life is reduced.

9 Cautions in designing compression plate and housing

Crossed roller bearing is compact and slim and thus plate and housing stiffness and bolt torque shall be evaluated when designing the installation.

Should the stiffness of the plate or housing be insufficient, tight assembly of inner and outer ring would be difficult and deformation by moment load causes uneven contact and poor performance significantly.

1. Housing design for installation

Housing thickness shall be more than 60% of bearing section height

$$T = \frac{D-d}{2} \times 0.6\text{height}$$

T : housing thickness

D : outer ring dimension

d : inner ring dimension

2. Tap for separation

Separation tap would help separate the inner & outer ring without damage to bearing

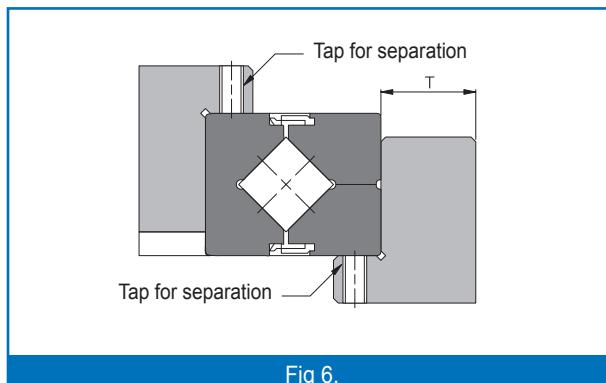

Fig 6.

3. Installation & assembly

Please see the Fig below for installation & assembly

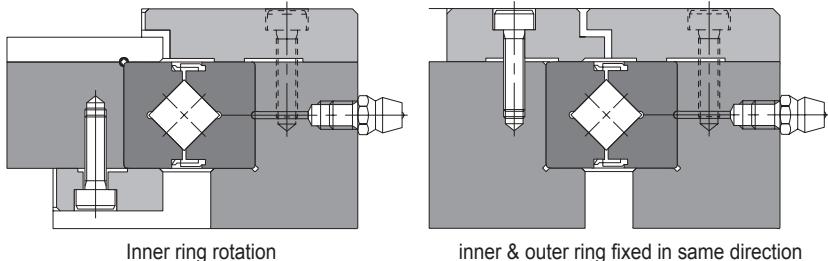

Fig 7. Example of installation and assembly

4. Selection of compression flange and bolt

The more compression bolt, the higher the stability. See Table 5 for layout
Please see the Table below for flange thickness (F) and gap (S)

$$F = B \times 0.5 \sim B \times 1.2$$

$$H = B^0_{-0.1}$$

$$S = 0.5\text{mm}$$

Bolts shall be tightened with appropriate torque to prevent them from loosened and when axis and housing are in a light alloy, steel shall be used.

When using common medium or hard steel, please refer to the Table below

Table 5. No and size of compression bolt Unit : mm

An external diameter of Outer ring(D)		Number of bolt	Bolt size
More	Less		
-	100	8 or more	M3 ~ M5
100	200	12 or more	M4 ~ M8
200	300	16 or more	M5 ~ M12

Table 6. Maximum clamping torque of bolt Unit : N·m

Symbol	Clamping Torque	Symbol	Clamping Torque
M3	2	M8	30
M4	4	M10	70
M5	9	M12	120
M6	14	-	-

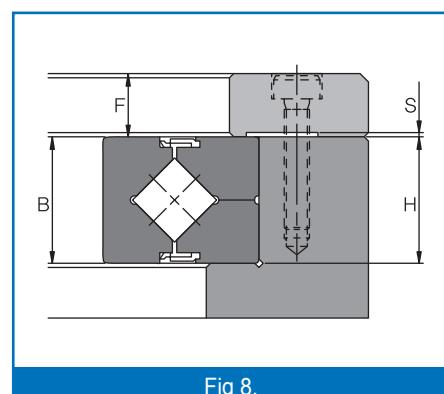

Fig 8.

※ Assembly sequence

Assembly sequence of Crossed Roller Bearing is as follows

1. Pre-inspection before assembly

Check to ensure no contaminant, scratch or sharp edge in housing or parts

2. Assembly of axis or housing

Because the bearing is compact type, it's easily inclined during assembly process and thus it shall be inserted gradually after making it horizontally balanced using plastic hammer and while hammering the circumference of outer ring till the part is set in place completely

3. Installation of compression flange

1) After putting the flange in place, it shall be assembled while checking the bolt if it's in right place

2) Bolt shall be tightened after confirming the bolts are in place accurately

3) Bolt shall be tightened over two to 5 stages from temporary tightening till complete tightening. In case that inner ring and outer ring are separated, check the position while turning the integral axis slowly and tighten the bolts over two to five stages gradually.

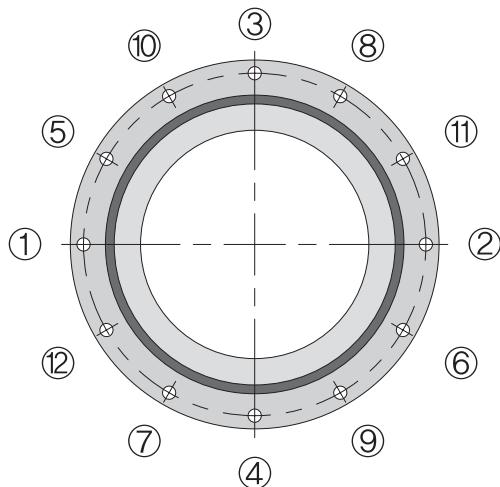

Fig 9.

10 Fitting

Please refer to the Table below for fitting

Table 7. Recommended fitting under average load

Radial internal gap	Tolerance range class			
	Load fixed to inner ring rotation		Load fixed to outer ring rotation	
	Axis	Housing hole	Axis	Housing hole
G ₁ gap	h5	H7	g5	J7 ⁽¹⁾
G ₂ gap	j5	H7	g5	J7 ⁽¹⁾

Note(1) small edge joint according to measured value is recommended

Table 8. Recommended fitting for normal gap of slip type

15 Cautions when handling Crossed Roller Bearing

1. Insufficient stiffness of the parts to be assembled causes the stress concentrated on contact surface between orbital plane and roller, thereby weakening the performance of the bearing. At the environment with greater moment, housing stiffness and bolt strength shall be thoroughly evaluated.
2. Special synthetic rubber and resin are included in the parts of Crossed Roller Bearing and thus please contact WON ST when using at 80°C or higher temperature
3. Dimensional tolerance shall be in accordance with the requirements to ensure inner & out ring will be tightly contacted with the sides
4. Crossed roller bearing is vulnerable to impact by falling or striking and thus when exposed to impact, check carefully if any functional defect is found despite of no damage is visually found
5. Foreign material once penetrated into the bearing may cause the damage to function and thus protection the bearing from dust or cutting chip shall be provided.
6. Bearing when shipped out is filled with lithium grease and thus it may be used without filling grease. Oil inlet shall be designed to inject oil into inner & outer ring. Lubricant shall be injected at least every 6 months irrespective of working hours.
7. Additive or other lubricant needs to be avoided if possible
8. Please contact WON ST when using at particular environment with high impact or vibration load, clean room, vibration or low / high temperature

1 Ball Spline

1. Structures & Features

WON Ball Spline is an innovative linear motion system, in that balls accommodated in the spline nut transmit torque while linearly moving on precision-ground raceways on a spline shaft. Furthermore, one significant difference against the usual ball bush is that a single spline nut can exert preload. As a result of this ability, the Ball Spline is well suited for using under severe service conditions involving vibration and the application of impact loads, and in locations that require highly precise positioning and high-speed operation.

The Ball Spline has two loading ball rows to be arranged so that ball rows in the 2 grooves at $180^\circ\Delta$ to be precisely ground.

2. Transmission of High Torque

The Ball Spline has grooves to be very precisely ground in a round type closely to a ball diameter so that, if torque load is put over spline shaft and spline nut 2 rows are evenly put in the direction of the torque load within the 2 rows with load. The rotation center is automatically determined.

3. High load capacity and long life

The Ball Spline can be made compact, and besides stable safety & longer life should be guaranteed in spite of overload and torsional load.

4. Zero Gap

The Ball Spline minimizes clearance in the rotational direction Gap. Pre-loading on a spline nut can reduce Gap to zero if necessary, there by increasing rigidity.

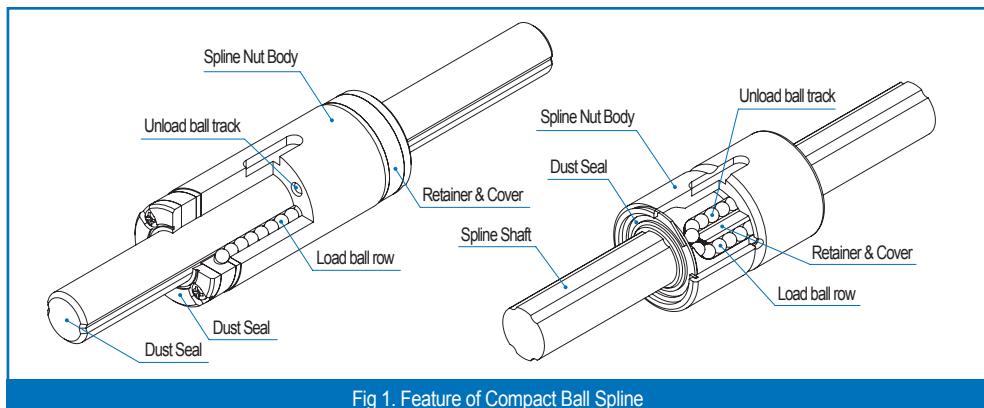

Fig 1. Feature of Compact Ball Spline

Ball Spline	Compact Ball Spline	- 2 rows and 4 points contact type - Simple structure and very compact
	Linear Ball Spline	- 4 rows and 2 points contact type - Angular contact type and high load rating of radial direction and torque direction

2 Selection of Ball Spline

1. Overview

To select Ball Spline, most of all identify detailed requirements and prioritize the requirements to select the Ball Spline suitable for the service conditions.

2. Procedure

- | | |
|--|--|
| 1 Identify service conditions | ▶ equipment, maintenance structure, installation space, assembly status, functional requirements, service conditions |
| 2 Select the type of Ball Spline | ▶ Select the appropriate type by considering motion condition, load level, rigidity, friction, and assembly |
| 3 Select the model number of Ball Spline | ▶ Determine the model number and the quantity of nut by considering the space and load |
| 4 Calculate load | ▶ Calculate the load in vertical and horizontal directions and moment |
| 5 Calculate equivalent load | ▶ Calculate each load applied to the nut and shaft by converting it into equivalent load |
| 6 Calculate mean load | ▶ Calculate each load applied to the nut, shaft and variable load during deceleration by converting them into mean load |
| 7 Calculate static safety factor | ▶ Calculate the static safety factor identified by basic load rating and max. equivalent load and check if it fits for service conditions |
| 8 Calculate life | ▶ Check if it fits for service conditions by calculating load rating and life |
| 9 Review preload & clearance | ▶ Select the pre-load and clearance suitable for service conditions |
| 10 Determine the class of precision | ▶ Determine the class of precision required by Ball Spline while driving or rotating |
| 11 Lubrication, dust proof, surface handling | ▶ Select lubricant suitable for the environment using grease, oil, and special grease lubrication and select seal for dust proof / determine the method of surface handling for rust prevention and low dust raise |
| 12 Complete selection | ▶ Complete the decision of final specifications of Ball Spline |

3 Life Calculation

1. Life

If external load is applied to Ball Spline while driving, fatigue fracture occurs by stress created as load is repeatedly applied to the raceway surface and rolling elements, and flaking-peeling off in scale-like flakes arises. A total driving distance until flaking occurs due to initial fatigue fracture is the life of a linear motion guide.

- Defects may occur in Ball Spline earlier than when flaking normally occurs due to wear or fatigue in the following cases:

- Excess load by the imprecise assembly following a difference in temperature or tolerance
- If Ball Spline is contaminated with foreign substance
- Driving with insufficient tension
- Reciprocating motion in a very short distance in the form of vibration or wave during the halt or drive
- Excessive load to Ball Spline
- Deformation of plastic end-plate

2. Rating fatigue life L

Generally Ball Spline does not always have same life even though the products are manufactured in the same way because of the difference in scattering of way material's original fatigue. For this reason, the reference value of life is defined as the rating fatigue life which is a total driving distance that flaking does not occur in 90% of Ball Spline in a group when having them run under the same conditions by grouping multiple Ball Splines with same specifications into a group.

Radial load rating

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50 \text{ km}$$

L : Basic life time (km)

C : Basic dynamic load torque (N)

T : Basic dynamic torque (N · m)

Pc : Calculated load (N)

P_T : Calculated torque (N · m)

f_H : Hardness factor(refer to Pic 4)

f_T : Temperature factor(refer to Pic 5)

f_C : Contact factor(refer to table 1)

f_w : Load factor(refer to table 2)

Torque load rating

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{T}{P_T} \right)^3 \times 50 \text{ km}$$

L_h : Life time (h)

l_s : Stroke length (m)

n_r : number of round-trip times per minute (min^{-1})

$$L_h = \frac{10^3 \cdot L}{2 \times l_s \times n_r \times 60}$$

- Hardness factor (f_H)

To realize the best performance of Ball Spline, the proper hardness and depth should be maintained between the nut contacting a rolling element (ball) and the raceway surface of shaft. WON Ball Spline has HRC58-64 surface hardness, so there is no need to consider hardness factor. But if the hardness is lowered than baseline, Ball Spline's load capacity decreases, so hardness factor needs to be reflected in calculating life.

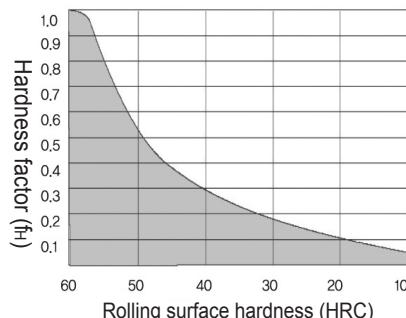

Figure 2. Hardness factor (f_H)

- Temperature factor (f_T)

If high temperature over 100 °C is applied to Ball Spline, temperature factor (f_T) needs to be taken into account when selecting Ball Spline. WON Ball Spline must be used at less than 80°C. But you have to use it at over 80°C, please use a high-temp Ball Spline -WON ST's specially customized product.

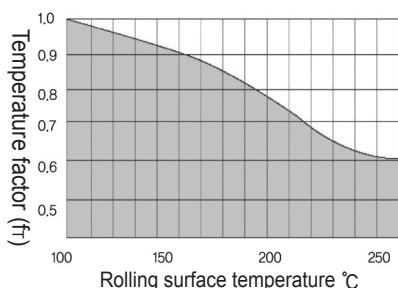

Figure 3. Temperature factor (f_T)

Note) In ambient temperature of over 80, materials for seal, end plate, and support plate should be changed to the specifications for high temperature.

- Contact factor (f_C)

If over two nuts of Ball Spline are closely assembled, since uniform load may not be applied to nuts due to difference among mounting surfaces, you have to multiply basic static load rating (C) and basic dynamic load rating (C_o) by contact factor shown in Table 2.

Table 2. Contact factor (f_C)

No. of nuts contacted	Contact factor (f_C)
2	0.81
3	0.72
4	0.66
5	0.61
Over 6	0.6
Common use	1.0

- Load factor (f_w)

Generally the static load applied to the nut of Ball Spline can be calculated by formula. But the load applied to the nut while running the machine tends to come from vibration or impact. Therefore, you have to consider load factor (f_w) shown in Table 3 for the vibration or impact load during the speedy running of the machine. It can be calculated by dividing the basic dynamic load rating of Ball Spline by load factor (f_w).

Table 3. Load factor (f_w)

External condition	Service conditions	Load factor(f_w)
Low	There is no external vibration or impact due to the smooth running of machine at mild speed.	1.0 ~ 1.3
Moderate	There is moderate external vibration or impact due to the running of machine at low speed.	1.2 ~ 1.5
Big	There is strong vibration or impact due to the running of machine at fast speed.	1.5 ~ 2.0
Very big	There is strong vibration or impact due to the running of machine at very fast speed.	2.0 ~ 4.0

3. Static safety factor f_s

Ball Spline cannot be gotten good movement caused by sectional permanent deformation on a ball and race way if heavy load or impact load act on it. In general, a limit in use depends on the working condition and the requirement of ball spline. In this case, static safety factor is obtained using the following equation and the general values shown in table 4.

$$f_s = \frac{C_o}{P_{ro}} \quad \text{or} \quad f_s = \frac{T_o}{P_{to}}$$

f_s : Static safety factor

C_o : Basic static load rating, (N)

T_o : Static rated torque, (N · m)

P_{ro} : Applied load (N)

P_{to} : Torque (N · m)

Table 4. Static safety factor (f_s)

Used environment	f_s
Vibration & impact	3 ~ 5
High running	2 ~ 4
General movement	1 ~ 3

4. Basic dynamic load rating C

Basic dynamic load rating means a load in regular size of stop diameter direction with the direction which travels at 50×10^3 m without material's damage(spalling or flaking) by 90% of fatigue when a group of angular Ball Splines are individually travelled.

Each value of basic dynamic load rating (C) is stated in the catalogue. (Refer to Fig. 4)

5. Basic static load rating Co

Basic static load rating defines a static load to be given a regular contact stress in the middle of contacting portion both of a rolling body with the maximum load and a track. (Refer to Fig. 4)

6. Basic dynamic rating torque T

Load rating torque means a torque in regular size with the direction which travels at 50×10^3 m without material's damage(spalling or flaking) by 90% of fatigue when a group of angular Ball Splines are individually travelled. (Refer to Fig. 5)

7. Basic static rating torque T_o · Basic static rating moment T_M

Basic static torque and static moment is defined as the constant stress in the middle of contacting portion both of a rolling body and a track under the maximum load when torque and moment (Refer to Fig. 5) are loaded. T_M indicated in the dimension table can endure static moment both of 1 and 2 outer nut to be adhered closely

4 Pre-load of Ball Spline

Pre-load

WON's angular Ball Spline can be pre-loaded in case that rigidity and high positioning repeatability in rotational irection are necessary. The average of pre-load is 1/2~1/3 of load, but the amount of pre-load is necessary to be selected with consideration of travel life of Ball Spline in case that vibration load or pulsating load is added, and especially high rigidity is necessary.

WON's angular Ball Spline serves with calculated pre-load based on the load in the circumferential direction. It is indicated according to the method of part number format. We serve the standard pre-load unless there is customer's special requirement/indication. Please inquire to WON in case of the pre-load exceeding light pre-load.

Table 5. Pre-load & Application

Type of pre-load	Symbol	Amount of pre-load	Application
Clearance	CL	0 ⁽¹⁾ ~ +	<ul style="list-style-type: none">Machines/Equipments for definitely simple operation
Standard	CM	0 ⁽²⁾ ~ -	<ul style="list-style-type: none">General machines/equipmentsMachines/Equipments to need small motion resistance
Light preload	CT	0.02Co	<ul style="list-style-type: none">Machines/Equipments to need rigidityMachines/Equipments for big vibration/impact loadMachines/Equipments with big moment load or pulsating load

Note(1) Zero or a little of clearance.

Note(2) Zero or a little of pre-load.

Remark) Clearance applies to WSP(F)(K) 4.Light pre-load does not apply to WSP(F)(K) 4

5 Accuracy

WON's angular Ball Spline has the accuracy of KS B 1422(JIS B 1193). It is divided into 3 grades-normal (no symbol), high(H) and Precision(P), and the details is shown in the Table 1~3. The symbol of the grades is marked by the arrangement of the part-numbers. The figures of the tables also include the precision of the case that the shaft-ends are processed(the portions both of supporting and parts mounting in Fig.2) can help even special requirements/inquires for other precision. The measuring method of accuracy is shown in Table 6.

Table 6. The torsion of Ball Spline

Accuracy grade	Torsion (MAX)		
	Normal grade	High(H)	Precision(P)

6 Lubrication and contamination prevention of Ball Spline

Ball Splines are taken care of by all mineral oils and anti-corrosive with affinity. Grease should be recommended for anti-corrosion as it can be lubricated by oil or grease, grease-lubrication additionally gives another sealing effect, and it can be easily adhered inside of Ball Spline. WON's Ball Spline is taken good care of protection against dust using by high quality lithium-soap group of grease with extreme pressure lubricant. Ball Spline with oil-hole to be machined on the nut is used for supplying grease.

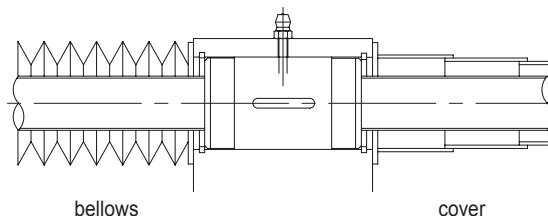

Figure 7. contamination-proof item example

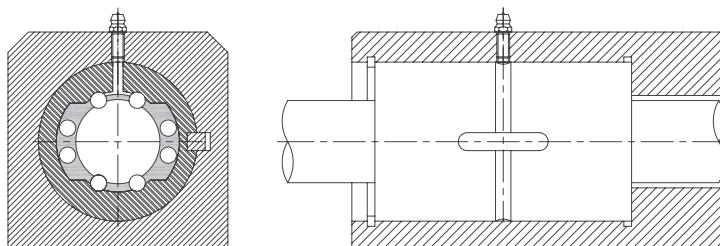

Figure 8. refueling item example

7 Assembly

Fitting

WON's Angular Ball Spline generally has a stop fit (J7) in fitting the nut and the housing.

In case that accuracy & rigidity are not so necessary, a clearance fit (H7) is used.

Insertion of the spline nut

When a spline nut is inserted into a housing, it can affect to the operation. Please use a tool for installation and insert it so as not to give any impact to retainer. (fig. 9)

Insertion of the spline shaft

When a spline shaft is inserted into a spline nut, a ball may come out. So that, it should be inserted after exactly setting the location of the track slot of the shaft, the row of balls of the spline nut and the location of the seal.

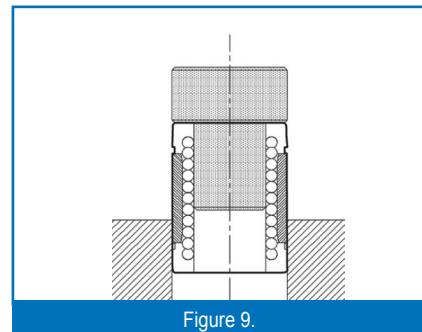

Figure 9.

8 Caution in Use

- ① WON's Ball Spline can be used in an environment up to a temperature 120°C, and up to 80°C for continuous use. Please inquire to WON for the application exceeding the temperature 80°C
- ② WON's Ball Spline has an optimum precision of adjustment at the same portion of both symbols of spline shaft and nut. (refer to fig. 10) When ball spline is installed in a machine, it is necessary to pay attention to keeping steering both nut & ball spline, the arrangement of nut and the steering direction.
- ③ In case that 2 nuts and more are used per shaft and so 2 keys and more is used on the rotational direction of outside fixing, the location of nut key ways should be parallel. For this case, please inquire to WON

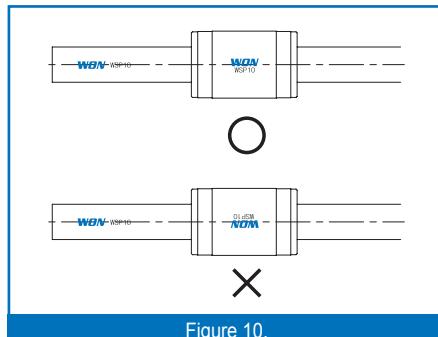

Figure 10.

9 Compact Ball Spline

1. Structure and Feature

The structure of WON Ball Spline is composed of nut and shaft.

Balls are in the nut and gothic arch grooves are on the shaft and balls in the nut roll on the grooves as linear movement on the shaft grinded precisely.

One nut withstands radial load, moment load and transfers rotation torque to circumferential direction of shaft. Preload can be adjusted by using the balls assembled between grooves on nut and shaft so this linear movement system could against high vibrating impact load and suitable for high precise position decision, high speed movement and longer life time.

2. High torque transfer

The grooves of spline are on the rolling face of nut and shaft which is ground precisely as gothic arch shape so balls contact with grooves by 4 points. Therefore 2 rows receive same load and transfer turning force under the condition of turning torque on shaft or nut owing to this kind of structure.

3. High load capacity and Long life

Ball Spline has compact structure but the rolling faces of nut and shaft meet ball, the rolling element by face contact. So it can sustain the rated load 10 times more than ball bush in the condition of same diameter and assure longer life time. It's very advantageous for miniaturization of facility and support radial load, moment load and overhang load.

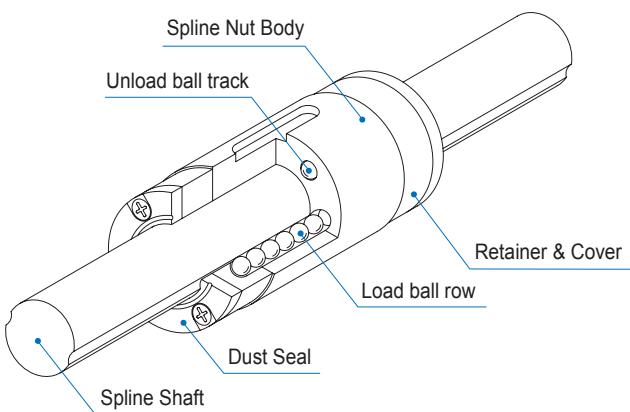

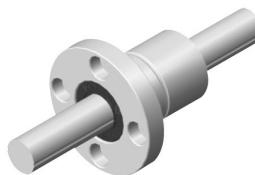

Figure 11. The structure of Compact Ball Spline

Classification	Type	Type & Features	
Round Type	WSP		Ball Spline nut has a machined key groove so that can fix exactly the position in rotational direction.
	WSPL		
	WSPT		It has the neat apperance as well as the stable strength according as retainer is inserted into the cover.
	WSPTO		
Flange Type	WSPF		It has enough strength as it is all-in-one both of flange and the body of Ball Spline nut. Easier installation with round flange.
	WSPFL		
	WSPK		Easier and more compact installation with square flange.
	WSPKL		
	WSPTF		It has enough strength as it is all-in-one both of flange and the body of Ball Spline nut. Easier installation with round flange.
	WSPTFO

10 Linear Ball Spline

1. Structure and feature

WON Linear Ball Spline is composed of shaft and nut both has groove as rolling raceway. Retainer, seal, balls are in spline nut which design make it move smoothly.

2. High load capacity and Long life

Raceway is ground as R shape almost similar to the diameter of ball so the contact area is wide and high load capacity and long life could be achieved.

3. Precise torque transfer

The raceway groove of shaft and nut controls balls with optimal contact angle so torque can be transferred by just 1 axis. And we can increase the load capacity or the degree of precise positioning decision by zeroised the gap of rotation direction which conveys preload.

4. High speed movement, High speed rotation

Cylinder is compact and the balance is good so it's good at high speed movement and high speed rotation.

5. Product classification

There are 8 sizes from 8 to 40 and 2 types of nut shape, cylinder type(WLS), flange type(WLSF).

* please contact WON if you need one with other raw material.

6. Easy for further processing

WON Linear Ball Spline has groove raceway for ball rolling on round shaft so it's easy for diverse further processing and popular on varied industrial fields.

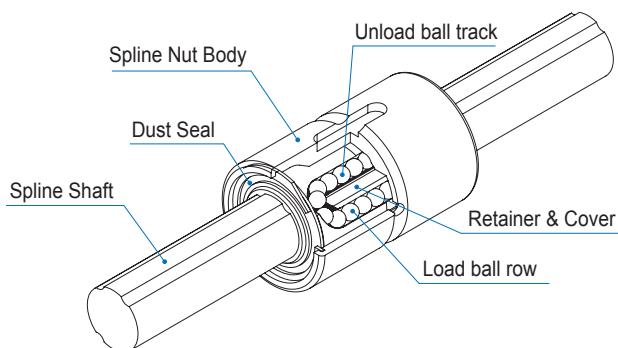

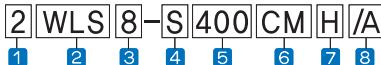

Figure 12. The structure of Linear Ball Spline

Classification	Type	Types & Feature	
Round type	WLS		Ball Spline nut has a machined key groove so that can fix exactly the position in rotational direction.
Flange type	WLSF		It has enough strength as it is all-in-one both of flange and the body of Ball Spline nut. Easier installation with round flange.

※ WON Linear Ball Spline can be selected for use and seal is in all type of nut as a standard component.

1 Cross Roller Guide Way

WON's Cross Roller Guide Way consists of the precisely ground raceway and the roller cage. The roller cage, in which precision roller are incorporated at right angle to one another, is fitted into to 90 v-grooved raceway machined on the race rail.

WON's Cross Roller Guide Way is compact linear motion system with high rigidity and high accuracy as a kind of linear motion bearing with low frictional resistance, tight clearance & non-circulation method by big rollers with big contact-areas as a rolling body. Therefore, the Cross Roller Guide Way is being applied to a wide range of equipment, a computer and peripherals, several precision equipments, a tool grinder, automatic lathe machines, electric discharge machines, and slides used in X-ray equipments, to name just a few.

1. Delicate slide, High rigidity & High accuracy

The number of the effective rolling body are many as the rolling body uses precision rollers and it is not circulated(non-circulation) So that, the rigidity is high, the load capacity is big, the fluctuation of frictional resistance is small and there is not almost the difference between the starting frictional resistance and the dynamic frictional resistance.

Therefore, in spite of delicate sliding, the linear motion can keep high precise accuracy.

2. Correspondence in load-direction & Zero-clearance

When two roller guides are installed in parallel, the resulting system can bear loads in all directions perpendicular to the rails. Moreover, since a preload can be applied easily, the system can be a highly rigid, nimble slide mechanism with no clearance.

3. Low noise

In Cross Roller Guide Way, a roller is contacted on the surface of the race rail. So that, the noise is low and rollers have a smooth movement without contact-noise as rollers are supported by a roller cage.

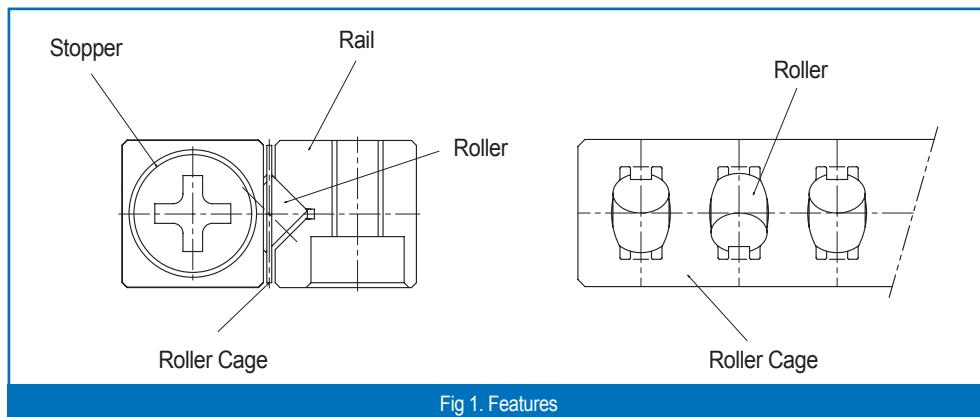

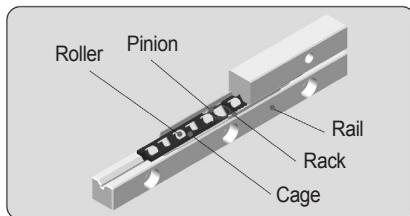

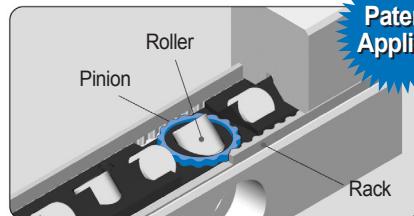

Fig 1. Features

2 Anti-Creep Cross Roller Guide Way

Anti Creep type Cross Roller Guide Way has anti-creep performance with the extremely high precision degree. It is built in a Rack and Pinion gear into the existing WON Cross Roller Guide Way.

WON Anti-Creep Cross Roller Guide Way Construction Plan

Anti-Creep Detail Plan

1. Meet the application diversity

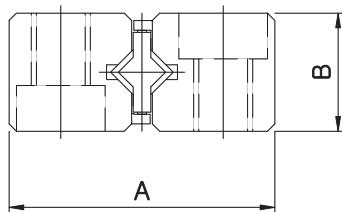

It is available to meet the ultra accelerated and reduced speed working condition by anti-creeping performance on the race rail so it is conveniently applicable to a vertical axis etc.

2. Low Noise and working very smoothly

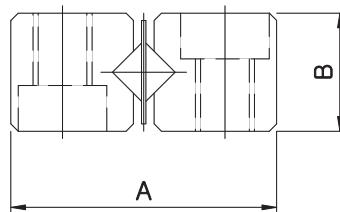

Plastic Cage is applied to it instead existing Steel Cage so it causes to minimize a noise between rollers and to work more smoothly and quietly as well.

3. Keep high load performance by the sound compatibility of assembly dimensions between old and new one

Our exclusive technology which the pinion gear wraps the cage roller enables to maintain perfectly compatible with load rating, stroke, assembly measurement as the number of roller is same with general cross roller guide way. 1)

Anti-Creep Cross Roller Guide Way

An Cross Roller Guide Way

Fig 2. Dimension compatibility

Note 1) The number of roller is not same to No1, No2.

3 Types & Features

Classification	Type	Feature	
Guide	Roller Cage		WON's Cross Roller Guide Way consists of the precisely ground raceway and the roller cage. The roller cage, in which precision roller are incorporated at right angle to one another, is fitted into 90v-grooved raceway machined on the race rail.
	WRG WRGO WRG-AC		WRG Guide Way is compact linear motion system with high rigidity and high accuracy as a kind of linear motion bearing with low frictional resistance, tight clearance & non-circulation method by big rollers with big contact areas as a rolling body.
	WRGW		
Table	WRGT		WRGU Cross roller guide is assembled between precision table and base. WRGT is compact and strong linear guide unit.
	WRGU WRGU-AC		

4 Accuracy

There are 3 kind of accuracy grades for WON Cross Roller Guide. Normal, High and Precision.

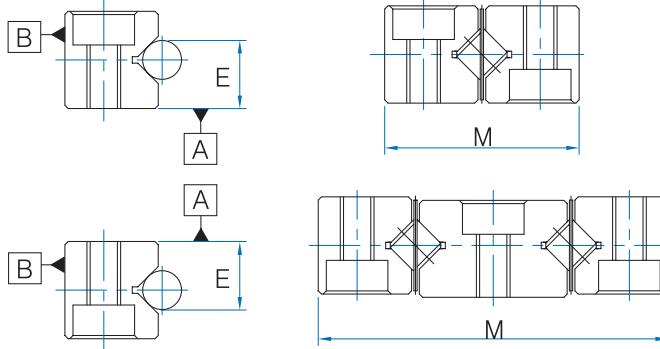

Table1. Accuracy for Race rail.

Accuracy grade Symbol	Normal	High	Precision
Items	No Symbol	H	P
Raceway parallelism to surface Ⓐ & Ⓑ	Refer to Table 2		
Dimensional tolerance for height E	±0.02	±0.01	
Height E difference among rails	0.02	0.01	0.005
Dimensional tolerance for width M	0	0	-0.1

Note 1) Difference of Height 'E' applies to 4 rails installed on the same plane.

Note 2) Please inquire to WON for another dimensions of Cross Roller Guide Way as we do.

Table2 . Raceway Parallelism to surface Ⓐ to Ⓑ

Unit: μm

Rail length	Accuracy grade Normal (No symbol)	High (H)	Precision (P)
Less than 200	8	4	2
From 200 to 400	10	5	3
From 400 to 600	14	7	4
From 600 to 800	15	9	5
More than 800	20	10	5

5 Safe working load & Service life

The basic load rating C_z , C_{oz} is calculate by the number of running roller(Z) in actual use and basic load ratings C , C_o Per running roller.

Basic dynamic load rating

$$C = \left(\frac{Z}{2}\right)^{\frac{3}{4}} \cdot C_z$$

Basic static load rating

$$C_o = \left(\frac{Z}{2}\right) \cdot C_{oz}$$

* $\left(\frac{Z}{2}\right)$ = The number of effective roller (Constant)

Rating life means overall running stroke without any material's damage(spalling or flaking) by 90% of fatigue when a group of LM System is individually travelled at the same conditions. Basic dynamic load rating is calculated by the rating life. Hence comes the life of Cross Roller Guide Way as the below equation.

$$L = \left[\left(\frac{f_H \cdot f_T}{f_w} \right) \cdot \left(\frac{C}{P_C} \right) \right]^{\frac{10}{3}} \cdot 100$$

L : Basic rating life (km)

C : Basic dynamic load rating (kN)

P_C : Calculated load (kN)

f_H : Hardness factor

f_T : Temperature factor

f_w : Load factor

When the stroke & the number of return are indicated, service life is able to be calculated.

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_1 \times 60}$$

L_h : Service life (hr)

l_s : Stroke (m)

n_1 : The number of return (o.p.m.)

Table 3. Hardness factor

Material of race rail	f_H
Carbon steel	1
Stainless steel	0.8

Table 4. Temperature factor

Raceway temperature (°C)	f_T
100	1.00
120	0.97
140	0.93
160	0.88
180	0.82

Table 5. Load factor

Impact & Vibration	Velocity (V)	Measured value (G)	f_w
No Shock vibration from outside	Low speed $V \leq 15\text{m/min}$	$G \leq 0.5$	1.0~1.5
Small Shock vibration from outside	Middle speed $15 < V \leq 60\text{m/min}$	$0.5 \leq G \leq 1.0$	1.0~1.5
Shock vibration from outside	High speed $V > 60\text{m/min}$	$1.0 \leq G \leq 2.0$	1.0~1.5

6 Pre-load

In Cross Roller Guide Way, the application of an excessive preload may cause dents, shorten the service life, and lead to similar problems. The mounted torque of Adjust Bolt should be observed while checking the permissible pre-load levels. (* Adjust Bolt is tightened on the same line with Roller.)

Table 6. Permissible pre-load levels for a row of Roller Cage

Unit: μm

Part No.	R1	R2	R3	R4	R5	R9
Permissible Preload	-2	-3	-4	-5	-7	-10

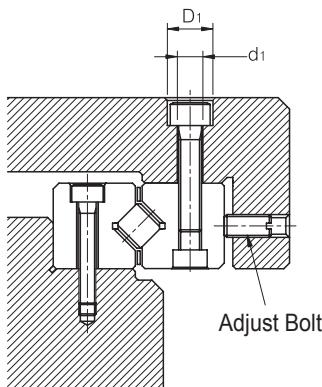

Fig 3. Adjusting pre-load

7 Accuracy of Mounting surface

To ensure high running accuracy, the rail mounting surface should be finished by grinding or a similar method, to a degree of equivalent to or greater than that of the Table. See Table 1

8 Installation Method

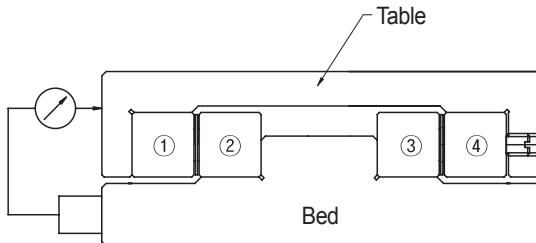

Fig 4. Installation Method

- 1) Press rails ① , ② & ③ firmly against the bed and the table, while correctly positioning the mounting surfaces.Firmly tighten the rail-mounting bolts.
- 2) Temporarily fasten rail ④ to the table and make a sure some space for inserting Roller Cage from the rail ends.
- 3) Position a dial gauge as shown in Fig. 4. While gently pressing the table, tighten Adjust Bolt uniformly until there is no slack.Then, attach stoppers to the rail ends, and set the dial gauge to zero.
- 4) Position Roller Cage at the center of rails as shown in Fig.5 Uniformly tighten Adjust Bolt by using a torque wrench or the like, until the dial gauge shows the specified displacement. Then, the displacement showing on the dial gauge is equal to the permissible preload. Fully tighten the mounting bolts within the adjusted area.
- 5) Slide the table from the right and left and complete the installation by mounting the remaining A djust Bolt(ⓐ, ⓑ in Fig.4) and the Tightened Bolt. at this displacement in the dial pre-load amount.Tighten the mounting bolts at the adjusted positions securely.move the table to the side, finish the installation as tightening the remaining adjustment bolts ⓒ, ⓑ in the same way.

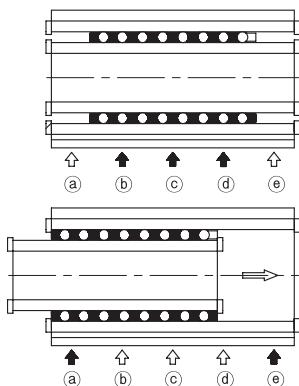

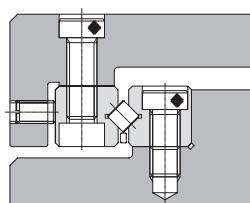

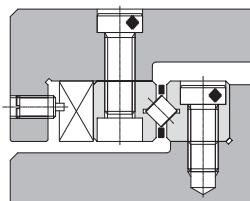

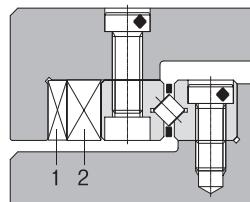

Fig 5. Order to bolting

Normally, the adjustment bolts press on the rail.

When high accuracy & rigidity are required, usd a holding bar.

When extremely high accuracy rigidity are required, use tapered GIBS 1 & 2.

Fig.6 Adjust Clearance

9 Lubrication & Contamination Prevention

WON's Cross Roller Guide Way(WRGT, WRGU) may be used as the high quality lithium-soap group of grease cares for it's lubrication. The same kind of grease is recommended for the supplement. We recommend to attach a cover to protect a cross roller guide way as the below Fig.8 in case that a lot of foreign matters or dusts enter into a cross roller guide way and it is used in the kind of environment where is big foreign matter as like cut tips or sand. (Fig.7)

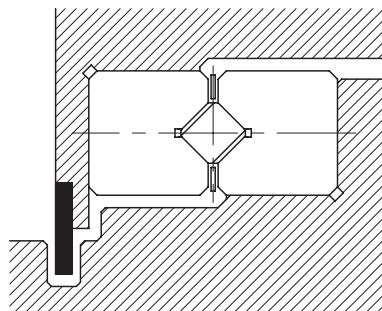

Fig.7.

10 Caution in Use

1. Installation

WON's Cross Roller Guide Way should observe the uniform pre-load and the mounting torque. When the pre-load is adjusted poorly and the accuracy of the supporting plane is low, the motion accuracy deteriorates. This causes skewing and adversely influences the life.

2. Stopper

Stoppers are provided at the rail ends to prevent cages from falling off. A stopper for the table should be separately installed in outside.

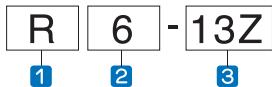

3. One set of use

In WON's Cross Roller Guide Way, one set of WRG type consists of 4 race rails, WRGW type consists of 3 race rails for one set.

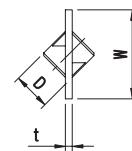

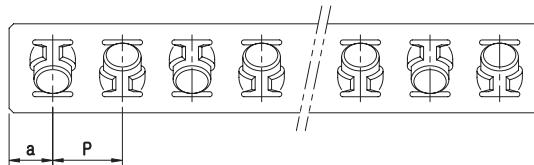

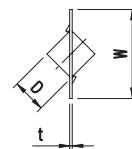

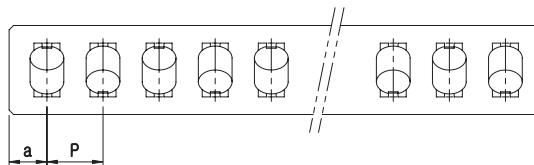

The pair reciprocal tolerance between the individual V-grooves is adjusted within one set and so, to combine the different sets may be a factor to deteriorate the life and the accuracy by reciprocal error. Therefore, installation should be paid attention to these points.

1 Super Ball Bushing

WON have begun home production of Super Ball Bushing at the first time in Korea. Super Ball Bushing for use in heavy load and self-aligning has features as follows.

1. 27 Times longer Travel life (3 Times Higher Load Capacity)

WON Super Ball Bushing affords the designer 27 times longer travel life than conventional ball bushing with the same as-installed dimensions due to the high running speed and 3 times higher dynamic load capacity.

WON Super Ball Bushing consists of hardened steel segmental load bearing plates with precisely ground ball tracks to be designed a little bigger than the ball diameters for unbeaten smooth running and high load. As 0.5° Self-Aligning feature provides uniform load distribution over the entire row of balls and therefore prevents life shortening by partial concentrated pressure.

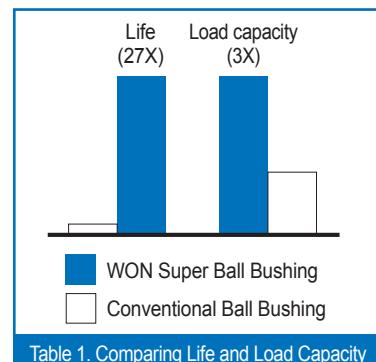

Table 1. Comparing Life and Load Capacity

2. 0.5° Self-Aligning

WON Super Ball Bushing automatically compensates for 0.5° Self-Aligning in the axial direction. The outer surface of the steel load bearing plates is designed with the curved surface. This self-aligning feature allows Super Ball Bushing to absorb misalignment caused by inaccuracies between ball bush and shaft so that uniformly distributes load over the entire row of balls. Besides this feature provides smooth entry and exit of the balls into and out of the load carrying area. (The Self-Aligning feature requires two Super Ball Bushings to be mounted on at least one of two shafts of the assembly.)

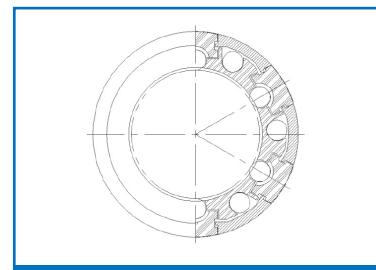

Fig 1. The cross-section of Super Ball Bushing

3. Ease of Replacement

WON Super Ball Bushing is completely interchangeable because of it's standard dimensions and strict precision control; SB(JIS standard) for Asian market service and SBE(ISO standard) for Europe market service.

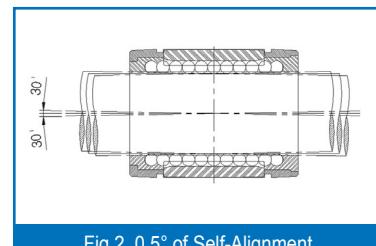

Fig 2. 0.5° of Self-Alignment

4. High speed and Fast acceleration

WON Super Ball Bushing guarantees velocity 3m/sec and acceleration 150m/sec

5. Ease of Adjusting the radial clearance

When WON Super Ball Bushing is installed into a housing for adjustable clearance, it's bearing plates in the radial direction makes the radial clearance to be easily adjusted for precise and strict running.

- Adjusting the Zero clearance

After Super Ball Bushing is installed into a housing for adjustable clearance, the radial clearance must be reduced by means of an adjusting screw in the bushing housing until a slight resistance is felt when the shaft is turned.

In application subject to vibration, the adjusting screw should be suitably secured against working loose once the desired clearance has been established.

- Pre-load

If pre-load is required, we recommend that zero clearance should be established as described above using a dummy shaft whose diameter is smaller by the amount of the desired pre-load(μ)than the actual guide shaft diameter(d) on which the linear bushing is to run.

6. Installation cost reduction

WON Super Ball Bushing provides the reduction both the installation time and cost by the Self-Aligning feature against errors to be caused by inaccurate machining, mounting errors or shaft deflection.

7. Smooth Running

Self-Aligning feature makes easy entry of the balls into the load carrying area. As the bushing and the retainer are made of light and durability of abrasion polyamide, the inertia force and the noise are small. Therefore the friction factor of unsealed WON Super Ball Bushing using oil as a lubrication up to 0.001.

8. Environmental Temperature

Use at the higher temperature than 100°C reduces the traveling life. (See Temperature factor of the page A-4.)

3 Life Span

As long as the linear system is reciprocated while being loaded, continuous stress acts on the linear system to cause 'flaking' on the rolling bodies and raceway surface because of material fatigue. The traveling distance of linear system until the first flaking occurs is called the life of the system.

1. Basic Dynamic Load Rating (C)

The term is arrived at based on an evaluation of a number of identical linear systems individually run in the same conditions. If 90% of them can run with the load (with a constant value in a constant direction) for a distance of 50×10^3 meters without damage caused by rolling fatigue. This is the basis of this rating.

2. Hardness factor (f_H)

The shaft must be sufficiently hardened when a side bushing is used. If not properly hardened, permissible load is lowered and the life of the bushing will be shortened. If the temperature of the linear systems exceeds 100°C, the rating life will be shortened.

$$L = \left(\frac{C}{P} \cdot f_H \cdot f_T \cdot f_D \right)^3 \cdot 50(\text{km})$$

L : Running distance life (km)

C : Basic dynamic load rating (N)

T : Basic dynamic torque (N·m)

P : Applied load (N)

f_H : Hardness factor (fig 5.)

f_T : Temperature factor (fig 6.)

f_D : Load direction factor (fig 8.)

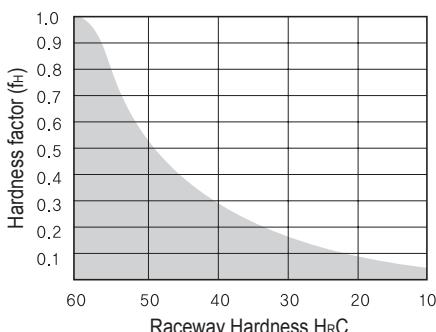

Fig 5. Hardness factor (f_H)

$$L_h = \frac{L \cdot 10^3}{2 \times l_s \times n_1 \times 60} (\text{hr})$$

L_h : Service life (hr)

L : Running distance life (km)

l_s : Stroke Length (m)

n_1 : Number of strokes per minute (o.p.m.)

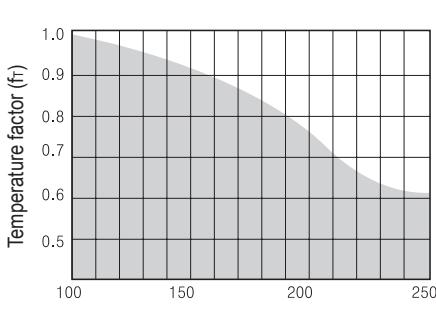

Fig 6. Temperature factor (f_T)

3. Temperature factor (fr)

If the temperature of the linear system exceeds 100°C, the rating life span will be shortened. (fig 6.)

4. Load direction factor (fd)

The stated load capacities in dimension table are valid for installation in 'min' position. (fig 7.) If the load is acting in any other direction, these load capacities must be changed by factor 'C' and 'C0' as (fig 8.)

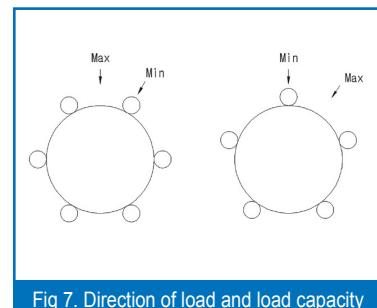

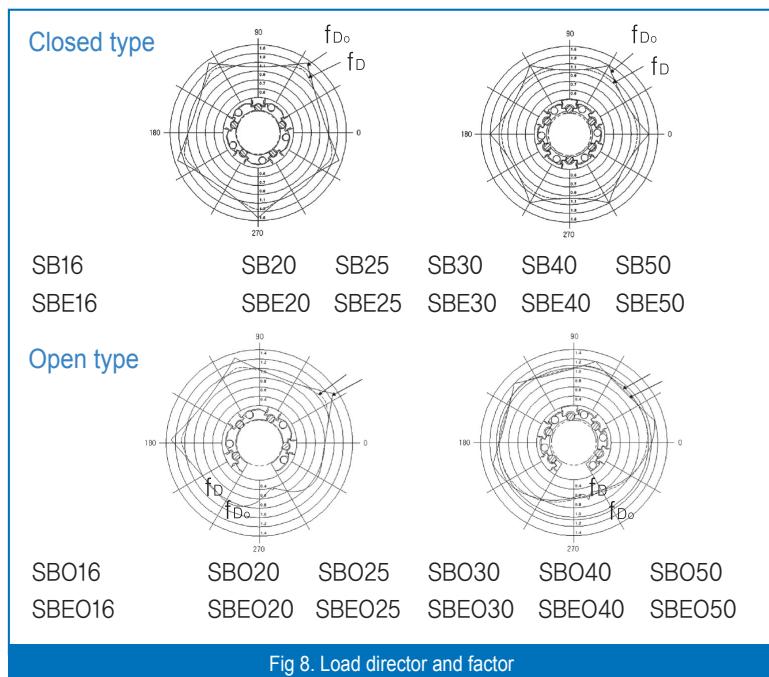

Fig 7. Direction of load and load capacity

5. Basic Static Load Rating (Co)

This term defines a static load such that, at the contacting position where the maximum stress is exceeded, the sum of the permanent deformation of the rolling plane is 0.0001 time of the diameter of the rolling elements. If inertia force exceeds the Static Load Co by vibration, shock or high speed, the linear motion would be rough as well as the life would be very reduced. Thus, these points should be paid attention to.

6. Housing and Shaft tolerance

Housing is essential to use WON Super Ball Bushing and service life and accuracy is affected by the inner tolerance of housing.

You can refer to table 2~7 about housing and shaft tolerance to use Super Ball Bushing.

4 Assembly

WON Super Ball Bushing is very precise so it must be handled with meticulous care. Use of a jig(see illustration) is recommended for insertion into a housing and Care should be taken not to exert pressure on the ball reatainer or seals.

The edge of the housing bore must be charmfered as well as the ends of the shaft are also chamfered. And the WON Super Bushing is not tilted when it is pushed onto the shaft.

Reducing load capacity in short-stroke application

In short stroke application the service life of the WON shafts is shorter than that of the Super Ball Bushing. For this reason the life can be shorten up to about 70% by the stroke.

1 Linear Ball Bushing

WON Linear Ball Bushing, LM type, is the linear motion system with unlimited stroke by being applied with LM shaft. Because of the point contact between Balls and LM shaft, the minimum friction can be acquired and can provide you the high-precision motion.

1. Components and Features

As shown in Fig 1. WON Linear Ball Bushing provides the alignment of the balls toward the LM shaft by the single retainer and cylindrical shape of raceway. Outer sleeve is made of high-carbon chromium bearing steel, and does heat treatment and then inner and outer grinding process are applied.

2. Interchangeability

The dimensions of WON Linear Ball Bushing are standardized to have full interchangeability. LM shaft is provided with the cylindrical grinding to have high precision fitting clearance.

3. Rigidity Outer Sleeve

Hardened and precisely ground outer sleeve is made of bearing steel, and can be directly assembled with the needle bearing on outer surface.

4. High precision Retainer

The single body retainer guides 4~6 ball circuits, and it gives the precision guiding against the balls moving direction and smooth motion.

5. Application

WON Linear Ball Bushing is widely used in precision equipments; computer and peripheral equipments, measuring equipments, auto recording equipments, 3D measuring equipments, and linear motion system in machine for mass production; multi-axis drilling machines, punching process, tool grinders, auto-gas cutters, printing machines, card selectors, food packing machines, etc.

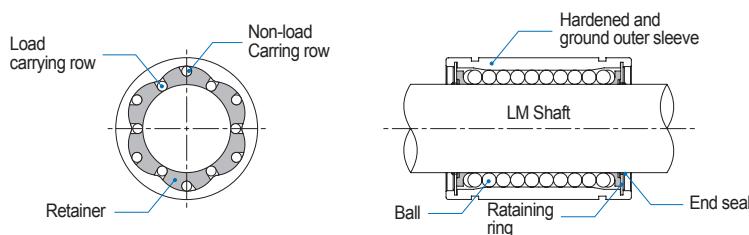

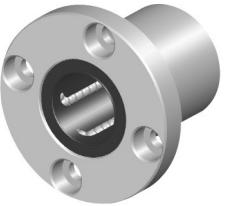

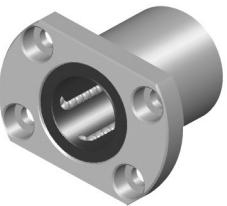

Fig 1. Linear Ball Bushing

2 Types and Characteristics

Classification	Type	Shape and Feature
Linear Ball Bushing	Standard LM LME	 <ul style="list-style-type: none"> - Cylindrical shape with precision dimension for smoother linear movement.
	Open Type LM□OP LME□OP	 <ul style="list-style-type: none"> - One ball circuit is removed from standard type which provides the maximum rigidity and stiffness when combined with Support Rail Unit.
	Adjustable Clearance Type LM□AJ LME□AJ	 <ul style="list-style-type: none"> - Outer sleeve is slotted in the axial direction to be adjustable the clearance between shaft and Linear Ball Bushing.
	Long Type LM□L LME□L	 <ul style="list-style-type: none"> - Two retainers are installed in Long type (Double-wide type) of outer cylinder for severe moment loads.

Classification	Type	Shape and Feature
Flange Type Linear Ball Bushing	Round Type LMF	 <ul style="list-style-type: none"> - Round Flange Type with mounting holes. - Easier and more compact installation
	Square Type LMK	 <ul style="list-style-type: none"> - Square Flange Type with mounting holes. - More compact design is available due to the lower center height.
	Two Side Cut Flange Type LMH	 <ul style="list-style-type: none"> - Two Side Cut Flange Type with mounting holes.
	Flanged Long Type LMF□L LMK□L	 <ul style="list-style-type: none"> - Two retainers are installed in Long type (Double-wide type) of outer cylinder for severe moment loads.

Outer Diameter of Shaft

1. Standard Tolerance

The tolerance of inner constant diameter, outside diameter, and length on Linear Ball Bushing are specified on the tables at from 14pages in this catalog, and inner contact diameter and outer diameter for adjustable and open types represents the diameters before being slotted.

2. Load Rating & Travel Life

The load rating of WON Linear Ball Bushing can be affected by the ball position against the load. The basic load rating on the table is that of Linear Ball Bushing when ball circuit is just beneath the load. As shown in Fig 2. If the balls are located in symmetrical position against the load, the load rating will be increased and the travel life will be extended.

$$L = \left(\frac{f_H \cdot f_C \cdot f_T}{f_w} \times \frac{C}{P} \right)^3 \times 50$$

$$L_{100} = \left(\frac{f_H \cdot f_C \cdot f_T}{f_w} \times \frac{C_{100}}{P} \right)^3 \times 100$$

L : Travel life (km)

L₁₀₀ : Travel life (km)

C : Basic dynamic load rating (N)

C₁₀₀ : Basic dynamic load rating (N)

P : Applied load

f_H : Hardness factor

f_w : Load coefficient

f_C : Contact factor

f_T : Temperature factor

4			5			6		
	$F=1.41 \times C$	$F=C$		$F=1.46 \times C$	$F=C$		$F=1.26 \times C$	$F=C$

C : refer to dimensions table

- If a Linear Ball Bushing or two Linear Ball Bushings are applied by the moment load, the calculation of the equivalent radial load is required.

$$P_u \doteq K \cdot M$$

P_u : Equivalent radial load (N)
 (when the moment is applied)

K : Equivalent factor (Refer to table 1~3)

M : Applied moment (N · mm)

P_u should be up to basic load rating

- If the moment load and the radial load are applied, the travel life can be calculated by the sum of the moment load and the radial load. From the above equations, the stroke and number of strokes per minute are constant, the travel life can be calculated by the following equation.

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_1 \times 60}$$

L_h : Travel life (hr)

l_s : Stroke (m)

L : Rated life (Km)

n_1 : Number of strokes per minute(o.p.m)

- When short stroke is applied, travel life is calculated by basic dynamic load rating multiplied factor K_c on Fig 3.

3. Calculation Example

The Maximum applied load and the travel life are the most important factors for choosing a proper size of Linear Ball Bushing. Below are the sample calculations of the expecting travel life and choosing a proper Linear Ball Bushing.

-Working conditions-

Operating speed

$$\begin{aligned} V &= 2 \times l_s \times n_1 \\ &= 2 \times 0.250 \times 60 \\ &= 30 \text{ m/min} \quad (f_w = 1.6) \end{aligned}$$

Applied load	:	250 N	(P)
Stroke	:	0.0250 m	(l _s)
Number of strokes per minute	:	60	(n ₁)
Shaft hardness	:	HRC 60	(f _H =1.0)

4. Calculation of expected Travel Life

Assuming the basic dynamic load rating is based on travel life of 50km and all other factor is 1.0, you choose the Linear Ball Bushing size that you can expect the travel life. Let's try LM40UU with the above working conditions.

$$L = \left(\frac{1.0 \times 1.0 \times 1.0}{1.6} \times \frac{2,150}{250} \right)^3 \times 50 \quad L_h = \frac{7,764 \times 10^3}{2 \times 0.250 \times 60 \times 60}$$

$$\doteq 7,764 \text{ km} \quad \doteq 4,313 \text{ hours}$$

Let's assume our design travel life is 15,000hours ;

$$L = 15,000 \times 2 \times 0.250 \times 10^3 \times 60 \times 60 = 27,000\text{km}$$

$$C = \frac{250 \times 1.6}{1.0 \times 1.0 \times 1.0} \times \sqrt[3]{\frac{27,000}{50}}$$

$$\doteq 3,257 \text{ N}$$

So, the proper Linear Ball Bushing for above condition is LM50UU which has 3,822N(390kgf) as the basic load rating.

4 Equivalent factor

Table 1. Equivalent factor for LM type

Part No.	Equivalent factor : K

Note) The equivalent factors for LME F/K/H and SH types are same as LM type.

Short stroke Application

In applications, when the stroke is short, the life of the shaft is shorter than that of the Linear Ball Bushing. In a short stroke applications, the required dynamic load rating must be multiplied by the factor K_c as found on Fig 3. below.

5 Lubrication & Friction

Usually, Linear Ball Bushing is used with grease lubrication or oil lubrication, but in some case, it is used without any lubrication.

1. Grease Lubrication

Before applying the grease, the anticorrosive oil must be removed by kerosene or organic solvent, and apply the grease after drying. Must apply grease directly on the ball for a both side sealed type (..UU). And apply same as above or on the shaft directly for a without sealed type. Lithium soap radical of viscosity mark No. 2 is recommended for use.

2. Oil Lubrication

There is no need to remove anticorrosive oil when oil is used for lubrication. ISO viscosity grade VG15 ~ 100 oil is usually according to the operating temperature.

Operating Temp.	Viscosity
-30°C ~ 50°C	VG 15 ~ 46
50°C ~ 80°C	VG 46 ~ 100

The turbine oil, machine oil, and spindle oil are usually used as lubrication oil. Drop the oil on the shaft for lubrication, or supply it through the oil hole provided on the housing. (Fig 4.) Contact WON for Linear Ball Bushing with lubrication hole for users demands.

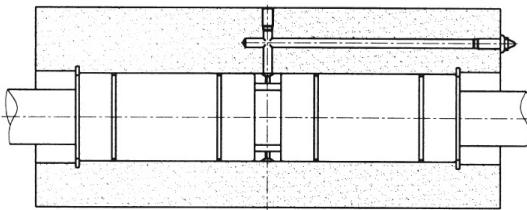

Fig 4.

Because the seals may remove the oil on shaft, oil dropping lubrication is not recommended for both sides seal type.

3. Coefficient of Friction

The balls in a Linear Bushing are the rolling elements, so the balls can reduce the frictional resistance. Static friction is particularly very low, and there is just little difference between static and dynamic friction, so, the stick-slip does not occur. Such low friction make submicron feeding possible. The normal friction coefficient is in Fig 5, and the friction resistance can be calculated by the following equation.

$$F = \mu \cdot P + f_s$$

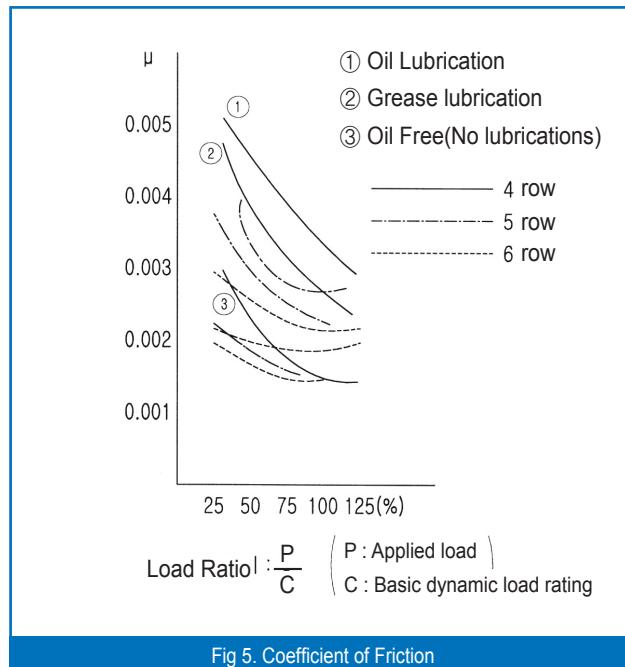

F : Friction resistance factor (N)

f_s : Resistant of Seal (1.3 ~ 204 N)

P : Applied load (N)

(Perpendicular load against shaft core)

μ : Friction coefficient (Static or dynamic)

6 Assembly

1. Tolerance of Housing Bore

Recommended tolerances of Housing bore for WON Linear Ball Bushing are in Table 4. Normal fit is standard, but for without clearance, press fit is also available

Table 4. Tolerance for House Bore

Type		Case	
Part No.	Grade	Normal Fit	Tight Fit
LM	High(H)	H7	J7
LME	-	H7	K6, J6
LMF			
LMK			
LMH			
LM-L	-	H7	J7
LMF-L			
LMK-L			
LMH-L			

2. Clearance of Outer Sleeve and Shaft

Normal fit is standard for using of Linear Bushing with LM shaft, and for without clearance, Tight fit is also available.

Table 5. Tolerance for Shaft Diameter

Type		LM Shaft	
Part No.	Grade	Normal Fit	Tight Fit
LM	High(H)	f6, g6	h6
LME	-	h7	k6
LMF			
LMK			
LMH			
LM-L	-	f6, g6	h6
LMF-L			
LMK-L			
LMH-L			

Note 1) When clearance after installation is required to minus, Allowable value of radial clearance is not allowed to exceed the value in the table.

Note 2) Axial clearance of SH, SHW, SHO type are same as High grade.

3. Mounting

High holding strength toward LM shaft direction is not required, but mounting with press fit only for mounting is not recommended. Please see the table 4 for tolerance of Housing Bore.

4. Standard type

Possible mounting methods are illustrated in Fig 6. and Fig 7. Mount a Linear Ball Bushing with retaining rings and cover plates.

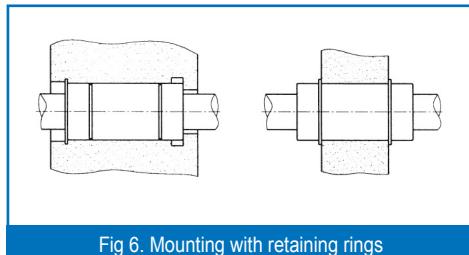

Fig 6. Mounting with retaining rings

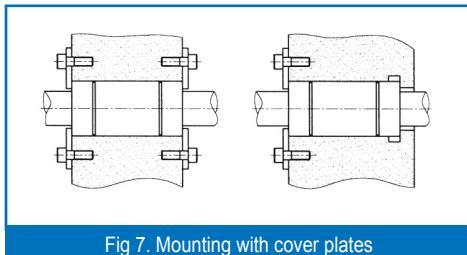

Fig 7. Mounting with cover plates

5. Retaining ring for Mounting

Retaining rings for mounting LM type WON Linear Ball Bushing are used as shown in the below table.

Part No.	Retaining ring			
	External(for shaft)		Internal(for Bore)	
	C type	Needle type	C type	Needle type
LM 5	10	10	10	10
LM 6	12	12	12	12
LM 8	–	15	15	15
LM 8S	–	15	15	15
LM 10	19	19	19	19
LM 12	21	21	21	21
LM 13	23	22	23	–
LM 16	28	–	28	28
LM 20	32	–	32	32
LM 25	40	40	40	40
LM 30	45	45	45	45
LM 35	52	52	52	52
LM 40	–	60	60	60
LM 50	–	80	80	80
LM 60	–	90	90	90

table 6. The information of above table is commonly applied to both LM and LM-L type.

6. Setscrew Mounting Prohibited

Mounting a Linear Ball Bushing with a setscrew as shown in Fig 8. will cause a deformation of the outer sleeve so that it should be avoided.

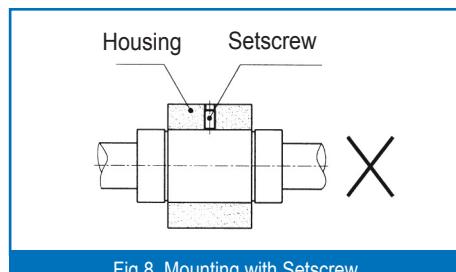

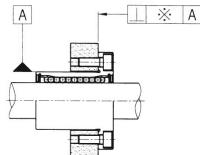

Fig 8. Mounting with Setscrew

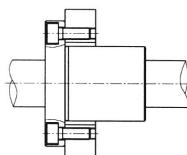

7. Flanged type

It is available for flanged types to be mounted itself only with mounting bolt due to its single body shape.
 note) Geometric dimensional tolerance should be considered when outer sleeve is the datum for installation.

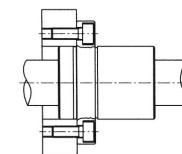

- Mounting from outer sleeve as datum

- Mounting of Flange with mounting bolt

- Mounting of Protrude Type

- Mounting of Middle Flanged type

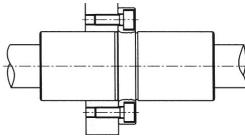

Fig 9. Mounting of Flanged type

8. Mounting of Adjustable type

Adjustment of clearance for adjustable type(...AZ) and LM shaft can be obtained by assembling with the adjustable type Housing. In the case, the slotted side of Linear Bushing should be located at 90° of open side of housing for uniform deformation in the radial direction. Please see Fig 10.

9. Mounting of Open type

Open type (...OP) also can be used with clearance adjustable housing as shown on Fig 11. Light pre-load is applied for normal using, but heavy pre-load should be avoid.

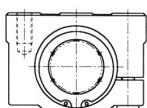

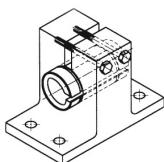

Fig 10. Mounting of Adjustable type

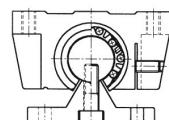

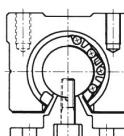

Fig 11. Mounting of Open type

10. Mounting of Shaft support

Shaft support, WK can be mounted with mounting bolt for a table, and LM shaft can be mounted with tightening bolt.

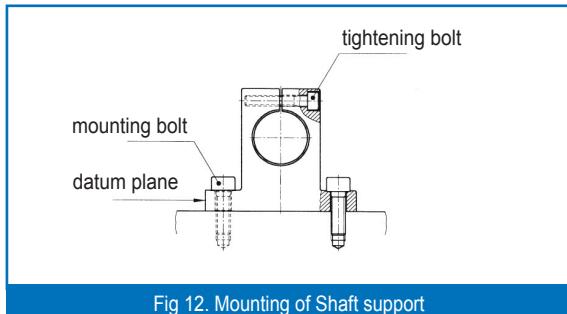

Fig 12. Mounting of Shaft support

7 Mounting of LM case unit

1. Mounting of SH type

Mounting of SH, SHW, SHO type from both the top and bottom side with mounting bolt are available and it gives minimum mounting time.

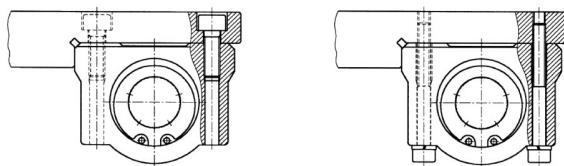

Fig 13. Mounting of Case Unit

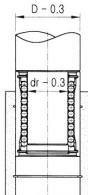

8 Cautions in use

1. Mounting of Linear Ball Bushing

For mounting of standard type WON Linear Ball Bushing into the Housing, a jig should be used to avoid direct hitting on the outer sleeve or seal during mounting, See Fig 14.

2. Insertion of Shaft

Care must be taken to align when inserting a shaft into a Linear Ball Bushing. If the shaft is inserted slantly, balls may be departed from the damaged or deformed retainer. See Fig 15.

D : outer diameter of outer housing
dr : inner diameter of inner housing

Fig 14. Mounting into housing

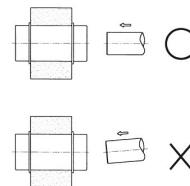

Fig 15. Insertion of Shaft

3. When Moment loads applied

External loads should be distributed uniformly on a Linear Ball Bushing. When moment loads are applied, two or more Linear Bushings should be used on one LM shaft, and the distance between two Linear Ball Bushings should have enough distance.

Calculate the equivalent load when the moment loads are applied and choose the proper Linear Ball Bushing. Please refer to the sample calculation for more information.

4. Avoid the Rotational Motion

WON Linear Ball Bushing is not suitable for rotational motion. See Fig 16. If the Linear Bushing is exposed to rotational motion, it may lead unexpected accidents.

5. Mounting of open type Linear Ball Bushing with three ball rows

Please mount the open type Linear Ball Bushings with three ball circuit as same as Fig 17. for considering of load distribution.

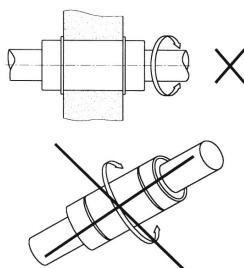

Fig 16.

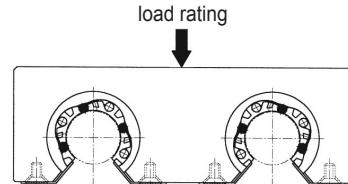

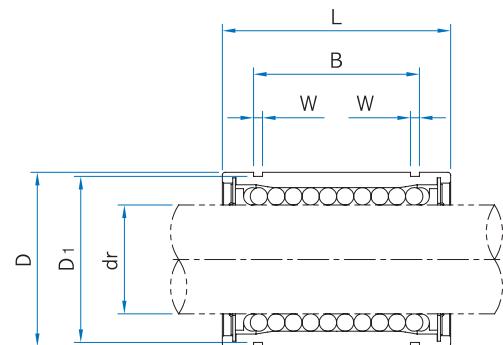

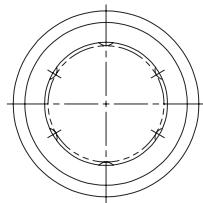

Fig 17.

Note) Plating and Raydent treatment are available

Reference of dynamic load rating

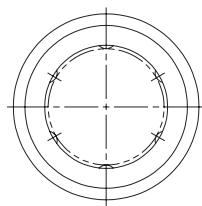

Dynamic load rating is based on the nominal life of 50km.

In case of 100km, C on the table needs to be divided by 1.26

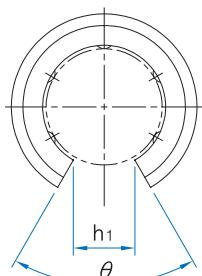

ex) LME 20 C : 860 N C₁₀₀ : 682 N

$$L = \left(\frac{C}{P} \right)^3 \times 50 \text{ km}, \quad L = \left(\frac{C_{100}}{P} \right)^3 \times 100 \text{ km},$$

1 LM Shaft

1. Type of LM Shaft

L.M.(Linear Motion) Shaft that WON "WON ST CO., LTD." has been manufacturing is hardened and ground shaft featuring high precision for rectilinear motion which can be used in conjunction with Ball Bushing. LM Shaft used in conjunction with Ball Bushing has a role as the guide of the ball bushing and the inner raceway of the bearing as well. The quality of shaft has a great influence on the functions of ball bushing and linear motion system.

2. Materials

- LM Shaft High Carbon Steel (WON ST Standard Materials)
- High Carbon Chromium Bearing Steel (KS STB-2, JIS SUJ-2)
- Martensite Stainless Steel (KS STS440C, JIS SUS440C)
 - In general, "High Carbon Chromium Bearing Steel" is used. For corrosion resistance or non-lubricant application, SUS440C is usually used; Chemistry, Food machinery, Medical instruments, Semiconductor, etc.
- Others(Not for Ball Bushing)
 - KS SMS45C(JIS S45C)
 - KS STS303(JIS SUS303)
 - KS STS304(JIS SUS304)
 - KS STS316(JIS SUS316)

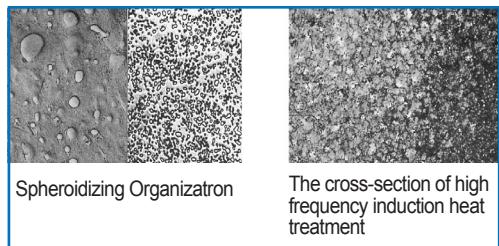

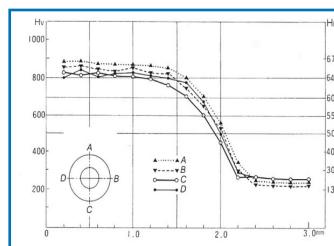

2 Heat Treatment

WON ST CO., LTD. applies the stable and reliable heat treatment technology to LM Shaft using high frequency induction by our own exclusive equipment for the heat treatment. The heat treatment by tempering assures the LM Shafts have uniform hardness in both radial and axial directions, developing an appropriate hardened layer.

1. Surface Hardness

- | | |
|------------------------------|--|
| KS STB-2(JIS SUJ-2)..... | HRC50 more~ |
| KS STS440C(JIS SUS440C)..... | $\varnothing 16\text{mm}$ more HRC56 ~ |
| | $\varnothing 13\text{mm}$ less HRC54 ~ |

Hardness distribution curve ▶

Spheroidizing Organization

The cross-section of high frequency induction heat treatment

Fig 1. Organization photographs

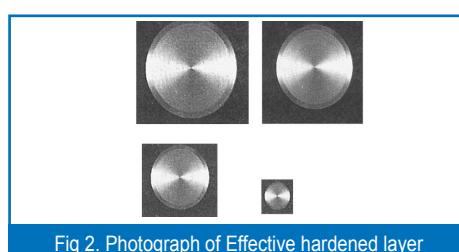

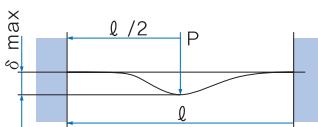

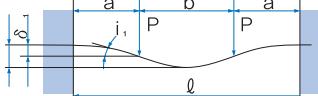

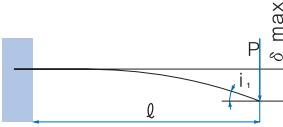

Fig 2. Photograph of Effective hardened layer

3 Precision Class

Diameter tolerance	Surface finish	Straightness
g6, h6, h5(mainly)	Rmax less 1.5µm	20µm / 300 mm less

4 Equation of Deflection-Angle of LM Shaft

Supporting method	Specified Conditions	Deflection equation	Deflection angle equation
Both ends fixing		$\delta_{\max} = \frac{P\ell^3}{192EI} = \frac{1}{4} \times P\ell^3 C$	$i_1 = 0$ $i_2 = 0$
Both ends fixing		$\delta_1 = \frac{Pa^3}{6EI} \left(2 - \frac{3a}{\ell}\right) = 8Pa^3 \left(2 \frac{3a}{\ell}\right) C$ $\delta_{\max} = \frac{Pa^3}{24EI} \left(2 + \frac{3b}{a}\right) = 2Pa^3 \left(2 + \frac{3b}{a}\right) C$	$i_1 = \frac{Pa^2b}{2EI \cdot \ell} = \frac{24Pa^2bc}{\ell}$ $i_2 = 0$
One ends fixing		$\delta_{\max} = \frac{P\ell^3}{3EI} = 16P\ell^3 C$	$i_1 = \frac{P\ell^2}{2EI} = 24P\ell^2 C$ $i_2 = 0$

δ_1 : Deflection at loaded point (mm)

i_1 : Deflection angle at supporting point

I : Geometrical moment of inertia(mm^4)

a, b : Loading point distance

P : Concentrated load(N)

δ_{\max} : Maximum deflection(mm)

E : Modulus of elasticity $2.06 \times 10^5 \text{ N/mm}^2$

i_1 : Deflection angle at loading point

ℓ : Span(mm)

C : $1/48EI(1/\text{N}\cdot\text{mm}^2)$

1. Case hardened & ground shaft

$$\text{Geometrical moment of inertia } (I) = \frac{\pi D^4}{64} (\text{mm}^4)$$

D = Diameter (mm)

The geometrical moment of inertia and the value of C($=1/48EI$) of each shaft as below.

DIA. meter	Geometrical moment of inertia $I (\text{mm}^4)$	$C=1/48EI (1/\text{N}\cdot\text{mm}^2)$
3	3.98	2.49×10^{-8}
4	1.26×10	7.87×10^{-9}
5	3.07×10	3.23×10^{-9}
6	6.36×10	1.56×10^{-9}
8	2.01×10^2	4.94×10^{-10}
10	4.91×10^2	2.02×10^{-10}
12	1.02×10^3	9.73×10^{-11}
13	1.40×10^3	7.09×10^{-11}
15	2.49×10^3	3.98×10^{-11}
16	3.22×10^3	3.08×10^{-11}
20	7.85×10^3	1.26×10^{-11}
25	1.92×10^4	5.17×10^{-12}
30	3.98×10^4	2.49×10^{-13}
35	7.37×10^4	1.35×10^{-13}
40	1.26×10^5	7.87×10^{-13}
50	3.07×10^5	3.23×10^{-13}
60	6.36×10^5	1.56×10^{-13}
80	2.01×10^6	4.94×10^{-14}
100	4.91×10^6	2.02×10^{-14}
120	1.02×10^7	9.73×10^{-15}
150	2.49×10^7	3.98×10^{-15}

● Example calculation

Obtain the maximum deflection of a shaft with a major diameter 25mm and a span of 430mm when a concentrated load of 80kgf is applied to the center of the shaft.(Ignore the weight of the shaft)

if) When both ends are fixed;

Assign the values to equation

$$P=784(\text{N}), l=430(\text{mm}),$$

$$C = 5.17 \times 10^{-12} (1/\text{N}\cdot\text{mm}^2)$$

in table

$$\delta_{\max} = \frac{1}{4} P l^3 C = 0.08 (\text{mm})$$

2. Hollow shaft

$$(I) = \frac{\pi}{64} \times (d_2^4 - d_1^4) (\text{mm}^4)$$

d_2 = Outer Dia. (mm), d_1 = Inner Dia. (mm)

Outer DIA. $d_2(\text{mm})$	Inner DIA. $d_1(\text{mm})$	Geometrical moment of inertia $I (\text{mm}^4)$	$C=1 / 48EI$ ($1/\text{N}\cdot\text{mm}^2$)
10	4	4.78×10^2	2.08×10^{-10}
13	6	1.34×10^3	7.40×10^{-11}
16	8	3.01×10^3	3.30×10^{-11}
20	14	5.97×10^3	1.66×10^{-11}
25	16	1.60×10^4	6.20×10^{-12}
30	17	3.57×10^4	2.78×10^{-12}
35	19	6.73×10^4	1.47×10^{-12}
40	20	1.18×10^5	8.41×10^{-13}
50	25	2.88×10^5	3.44×10^{-13}
60	30	5.96×10^5	1.66×10^{-13}
80	40	1.88×10^6	5.28×10^{-14}
100	50	4.60×10^6	2.16×10^{-14}

● Example calculation

The maximum deflection of a 1800mm length hollow shaft with outside diameter of 50mm and inside diameter of 25mm is...
(Next page)

if) When both ends are fixed;

According to condition $P = 100N$

$l=1800(\text{mm})$

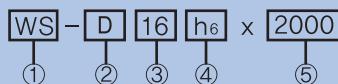

$C = 3.44 \times 10^{-13} (\text{N} \cdot \text{mm}^2)$

from the table, Therefore

$$\delta_{\max} = \frac{1}{4} P l^3 / C = 0.05 (\text{mm})$$

5 Part Number of LM Shaft

1. Type number format I (Case hardened & ground shaft)

① Type of LM Shaft

Case Hardened and Ground Shaft	WS	Conventional shaft to be used with Ball Bushing. - Material : High Carbon Steel (KS SM55C, JIS S55C) for LM Shaft, KS STB-2(JIS SUJ-2)
	WAS	The exclusive usage for Ball Bushing in use for high anti-corrosive applications under the oxidizing atmosphere such as water, vapor, chemical, food process machinery, semiconductor and medical equipments. - Material : KS STS440C(JIS SUS440C)
	WCS	Hard Chromium plated shaft providing a cost reduction in comparison to the stainless steel shaft with the same function as anti-corrosion. - Material : High Carbon Steel KS SM55C(JIS S55C) for LM Shaft, KS STB-2(JIS SUJ-2)

② Machining type and number (In case of standard shaft or simple cutting shaft, This is not necessary to be indicated)

D	Manufacture refer to drawing
---	------------------------------

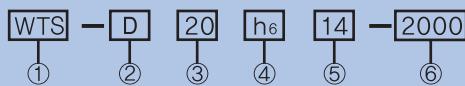

③Diameter (mm), ④Diameter Tolerance (μm), ⑤Length(mm)

DIA (mm)	Diameter tolerance (μm)			Standard stroked length L (mm)

60	-10 ~ -29	0 ~ -13	0 ~ -19							
80										

Note 1) Max. Length : 6000mm

2) Max. Diameter : Ø300mm

2. Type number format II (Hollow shaft)

① Type of LM Shaft

Hollow Shaft	WTS	Conventional hollow shaft greatly contributes to reduce weight and simplify equipment due to it's hollow structure. Also suitable for electric wiring for measurement, compression air, lubricant hydraulic piping, or robot arm. - Material : High Carbon Steel for LM Shaft, KS STB-2(JIS SUJ-2)
	WTCS	Hard chromium plated hollow shaft used with ball bushing for anti-corrosive applications. - Material : High Carbon Steel for LM Shaft, KS STB-2(JIS SUJ-2)
	WTAS	Stainless steel hollow shaft having the strength of both WTS and WAS. - Material : KS STS440C(JIS SUS440C)

② Machining type and number (In case of standard shaft or simple cutting shaft, This is not necessary to be indicated))

D	Manufacture refer to drawing
----------	------------------------------

③ Outer diameter (mm), ④ Diameter Tolerance (μm), ⑤ Inner diameter (mm), ⑥ Length (mm)

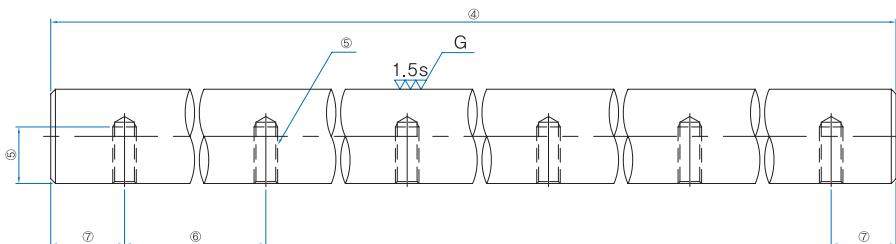

Outer Dia. (mm)	Inner Dia. (mm)	Diameter tolerance (μm)			Standard stocked length L (mm)
		g6	h5	h6

30	17				
35	19				
40	20	-9 ~ -25	0 ~ -11	0 ~ -16	
50	25				

1000, 1200, 1500, 2000, 3000

Note) Manufacturing shafts as per Customer's drawing.

3. Type number format III (Tapped shaft)

WBS - **16** **h6** × **2000** - **M5** × **200** - **100**

① Type of LM Shaft

Tapped Shaft	WBS	Standard tapped shaft. Material : High Carbon Steel (KS SM55C, JIS S55C) for LM Shaft, KS STB-2(JIS SUJ-2)	We recommend that these shafts should be applied with support rails for shafts and mainly applied in the environment for being occurred deflection or vibration feasibly.
	WBAS	Stainless steel tapped shaft for strong anti-corrosion. Material : KS STS440C(JIS SUS440C)	
	WBCS	Hard chromium plated tapping shaft for anti-corrosion with economical cost in normal use. Material : High Carbon Steel KS SM55C(JIS S55C) for LM Shaft, KS STB-2(JIS SUJ-2)	

② Diameter (mm), ③ Diameter Tolerance (μm), ④ Length (mm), ⑤ Tap size (mm), ⑥ Pitch(mm),
⑦ Distance from the last taps to The both ends of shaft (mm)

Outer Diameter D(mm)	Diameter tolerance (μm)			Standard length in stock L(mm)					Tap size	Pitch (mm)	Distance from the last taps to both ends (mm)
	g6	h5	h6	1000	1200	1500	2000	3000			
10	-5~-14	0~ -6							M4 x 0.7 x 6	100	50
12	-6~-17	0~ -8	0~ -11						M4 x 0.7 x 6	100	50
13									M4 x 0.7 x 6	100	50

DIA. D(mm)	Diameter tolerance (μm)			Standard length in stock L(mm)					Tap size	Pitch (mm)	Distance from the last taps to both ends (mm)
	g6	h5	h6	1000	1200	1500	2000	3000

50									M10x1,5x22	300	150

Note) Max. Lengths : DIA. 10 ~ 12mm : L.4000mm
 DIA. 25mm ~ : L.6000mm

6 LM Shaft End Support Block & Rail

1. Shaft End Support Block

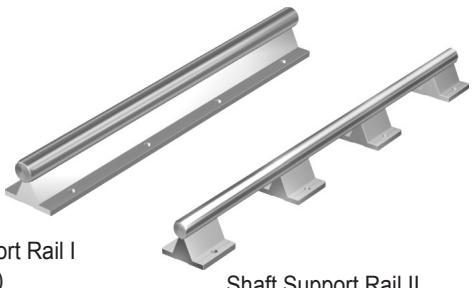

These support blocks can support the ends of LM Shaft without special machining.

There are blocks for a plane and a wall.

2. Shaft Support Rail

This support rail supports the tapping machined shaft in considering shaft deflection or vibration and makes 'Slide Rail Unit' by being assembled with open type of ball bushing.

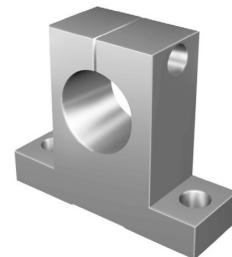

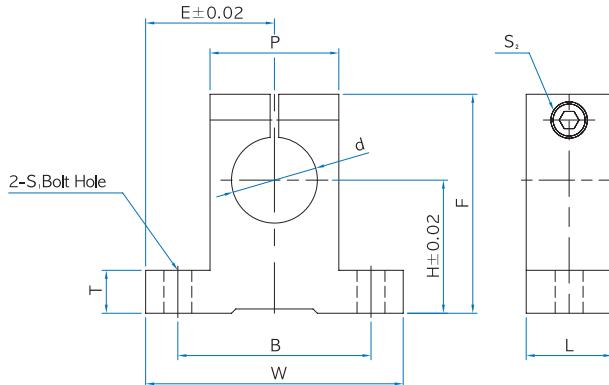

Shaft Support Rail I
(ST)

Shaft Support Rail II
(STU)

1 T.R Guide

1. Structure & Features

Outside Type

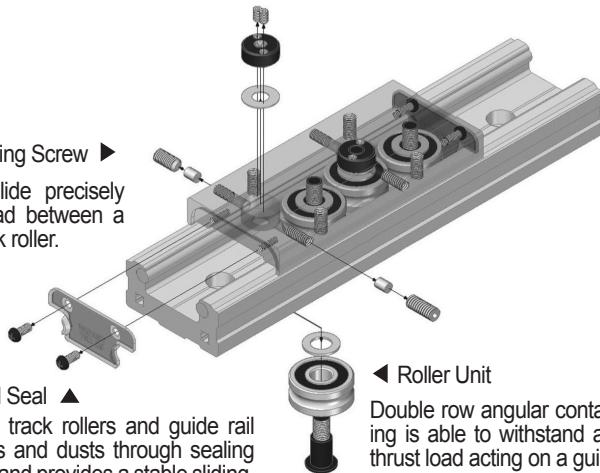

Double row angular contact ball bearing is able to withstand radial and thrust load acting on a guide.

Cap Seal

Cap Seal protects track rollers and guide rail from foreign debris and dust through sealing each roller and it lubricates through inner oil contained seal so that it increases a travel life and a running speed.

Inside Type

It is possible to slide precisely as adjusting pre-load between a guide rail and a track roller.

End Seal protects track rollers and guide rail from foreign debris and dusts through sealing at the end of block and provides a stable sliding.

Double row angular contact ball bearing is able to withstand a radial and thrust load acting on a guide.

WON Track Roller Guide has been developed by WON R&D Center based on knowledge and experience for several years in the field of Linear Motion System. It consists of the guide rail inserted by applying pressure onto a precisely grinded and heat treated (HRC 62) shaft and a roller unit.

2. Speed and Noise

Conventional Linear Motion Guide uses balls inside a sliding block and a series of balls recirculate in sliding block. That is why makes a noise, vibration and low speed. In case of Track Roller Guide(T.R Guide), it applies several roll bearings instead of a series of balls so that it is possible to reduce noise and vibration at the maximum rotational speed as follows.

- Maximum Speed V max = 10 m/s
- Maximum Acceleration A max = 50 m/s²

3. Adjustable Clearance

When preloads and backlashes are required between a guide rail and a track roller, it is feasible to adjust a clearance by using an adjustable eccentric screw.

4. Load Capacity in any direction

Track Roller is double row angular contact ball bearing so it can withstand loads in any direction.

5. Perfect Sealing and Lubrication

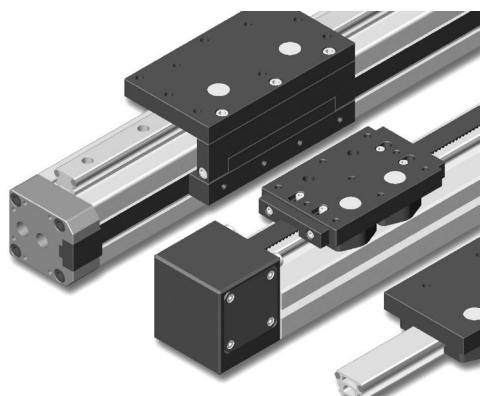

Cap Seal protects track rollers and a guide rail from foreign debris and dusts through sealing each roller and it provides lubrication into TR Guide through an inner oil contained seal.

6. Available Temperature

-20°C~80°C

7. Easy Installation

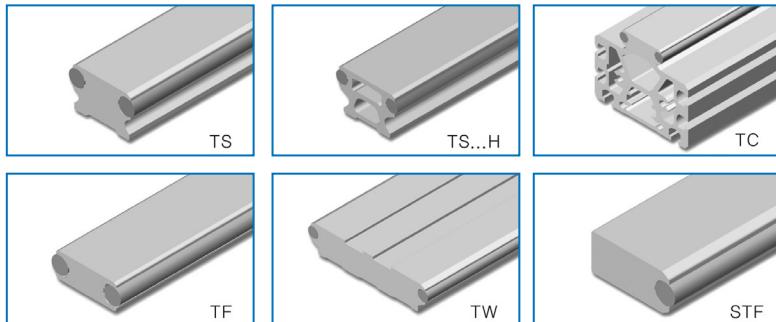

It is easy to install and handle due to light weight and compact structure. Because it provides a high speed sliding, a high precision and a compact structure, it is so easy to install and maintain that this is a very economical Linear Motion System.

T.R Guide

2 Guide Rail Series

1. Outside Type

Standard Length & Maximum Length

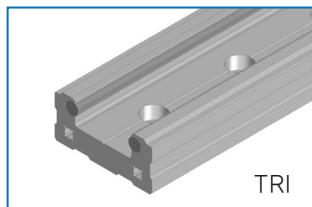

The table below shows the standard lengths and the maximum lengths of a guide rail. If the maximum length of a needed guide rail exceeds them, jointed rails will be used. When a special length is required, Please contact us.

Unit : mm

3 Types of Block

1. Outside Type

There are two kinds of blocks : Non-Adjustable Block and Adjustable Block.

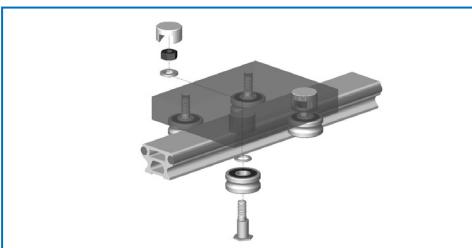

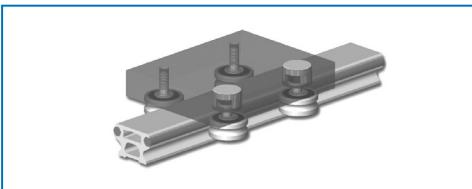

- Non-Adjustable Block

Non-Adjustable Block assembled with a precise guide rail at the best fit has a clearance within 20 μm between a rail and a block. It is unnecessary the eccentric screw for adjusting clearance so that it is economical in use.

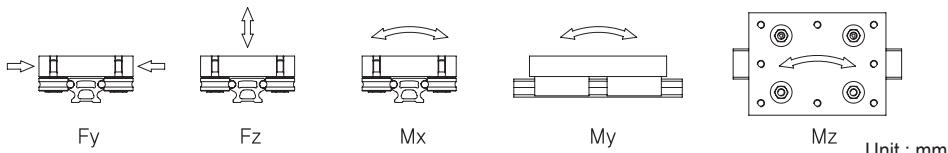

- Clearance Adjustable Block

Clearance Adjustable Block is used for setting Zero clearance or putting preload.

Maximum Allowable Load

4 Assembly and Adjustment

1. Outside Type

WON Track Roller Guide for a clearance adjustable block provides a precise sliding through adjusting a clearance to zero.

- 1) Coaxial bearing being the criteria for an adjustment is completely fastened up but eccentric axial bearing is fasten loosely so that remains enough a gap between a rail and an adjustable block.
- 2) With the state of the block assembled on guide rail, screws should be tighten up equally using a torque wrench until an eccentric axial bearing is contacted with a guide rail properly.
 - A) If the block assembled moves smoothly and each of track rollers rotates, the eccentric axial bearing should be adjusted correctly.
 - B) Please caution that it could shorten a life span of the eccentric axial bearing if the screws were tightened up excessively.
- 3) If the eccentric axial bearing were adjusted exactly, Please fasten lock nuts and bolts referring to recommended torque as below.

- Roller Assembly Torque(A)

Unit : mm

Part No.	20	25	32	42	52
Max (N·m)	2.0	8.0	8.0	46	46

- Rail Assembly Torque(B)

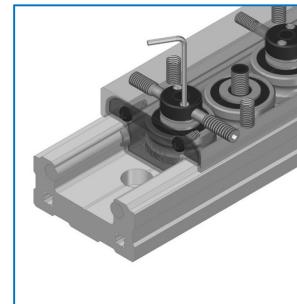

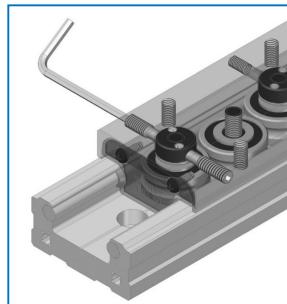

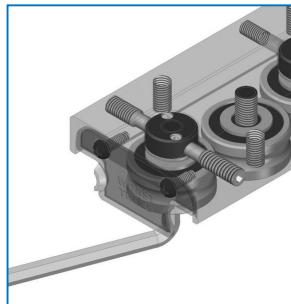

Part No.	M5	M6	M8	M10	M12
Max (N·m)	5.8	9.9	24	48	80

1N·m ≈ 0.102kgf · m

2. Inside Type

WON Track Roller Guide of an inside type (TRI) for a clearance adjustable block provides a precise sliding through adjusting clearance to zero.

- 1) Non-adjustable bearing being the criteria for an adjustment is completely fastened up but an adjustable bearing is fasten loosely so that remains enough a gap between a rail and an adjustable block.
- 2) With the state of the block assembled on a guide rail, the adjust screws at the side of block should be tighten up equally using a torque wrench until a roller is contacted with a guide rail properly.
- A) If the block assembled moves smoothly and each of track rollers rotates, the eccentric axial bearing should be adjusted correctly.
- B) Please caution that it could shorten a life span of LM System if the screws of adjustable bearing were tightened up excessively.
- 4) Please prevent loosening of a bolt as fastening a lock bolt.

- Roller Assembly Torque

Unit : mm

Part No.	15	20	25	30	35	45	55
Max (N·m)	2.0	2.0	8.0	8.0	46	46	46

Max (N·m)	2.5	5.8	9.9	9.9	24	48	80

1N·m ≈ 0.102kgf · m

5 Track Roller

There are two kinds of rollers for a shaft, eccentric and concentric rollers. Track roller is 2 row angular contact ball bearing.

Concentric Roller for Shaft

When it is not necessary to adjust a clearance it is used.

Eccentric Roller for Shaft

When it is necessary to adjust a clearance it is used.

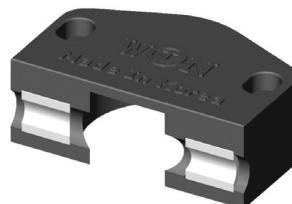

6 End Seal (T type)

Seal in the front and rear of the block protects a Shaft & roller from dusts, and increases the Service Life and stability of movement.

7 Cap Seal

Cap Seal protects shafts and rollers from dusts and stock oil. By doing so, increase a travel life and improves the stability of moving guide at high speed.

8 Cap Seal Assembly

We recommend that a cap seal should be assembled in the last step after completing the adjustment of rollers. To install a cap seal on the block, 1) Take off block from a guide rail, 2) Assemble a cap seal to block temporary so that secure an enough gap for a cap seal, 3) Assemble a cap seal to a guide rail tighten, 4) Adjust the gap between a cap seal and a block while approaching a cap seal to the surface of a shaft.

9 Accuracy

Accuracy of T.R Guide is measured as below method.

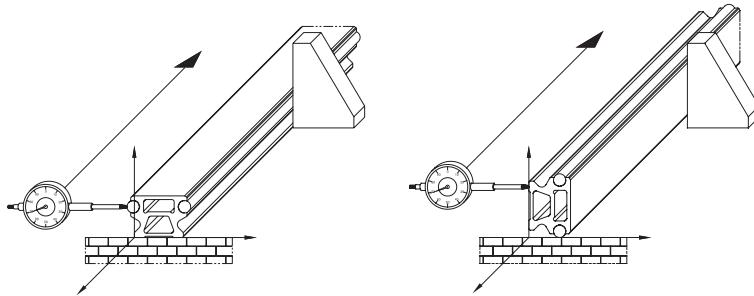

Fig 1. Measurement Method

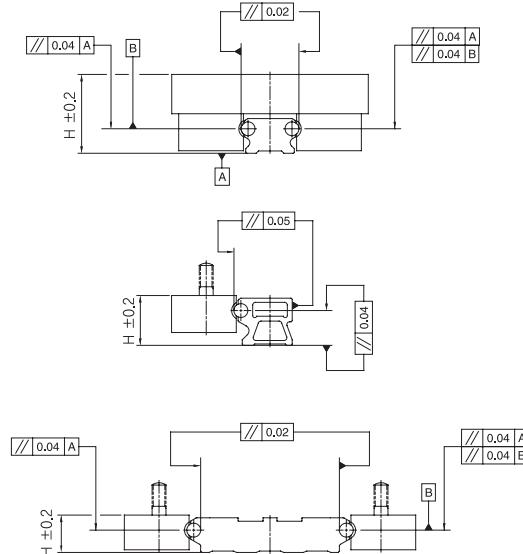

Fig 2. Accuracy

10 Service Life

Service life refers to the total running distance that 90% of identical bearings in a group, when one locked with another internally under the same conditions, can be achieved without developing flaking.

1. Basic Dynamic Load Ratings C (Basic Dynamic Moment M)

When a group of bearing under the same load(Moment) run, if 90% of them are not damaged and run 100Km, the load is called the basic dynamic load (Basic dynamic moment M).

2. Basic Static Load Ratings Co (Basic Static Moment Mo)

Basic Static Load Ratings Co (Basic Static Moment(Mo)) is a stationary force or couple applied to both a raceway and rolling elements as much as 0.001 permanent deformations unchanging in magnitude, points of application, and direction, which the sum of the permanent deformation on the rolling elements and that of the raceway at a contact area under the maximum stress.

3. Maximum allowable load(maximum allowable moment)

Maximum allowable load(maximum allowable moment) is maximum moment which is allowed not only for capability of load carrying of track roller but also for smooth linear motion as considering strength of a rail, block and bolt.

4. Service Life depending loads in any direction

$$L = \left(\frac{C_{yz}}{P}\right)^3 \cdot 10^5$$

$$L_h = \frac{L}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L	: Service life	(m)
L _h	: Service life	(h)
C _{yz}	: Basic dynamic load ratings of each direction	(N)
P	: Applied load in each direction	(N)
l _s	: Stroke	(m)
n ₁	: The number of return	(o.p.m.)

* When applied load is less than maximum allowable load C_{yz}, rating life shall be calculated from the equation above.

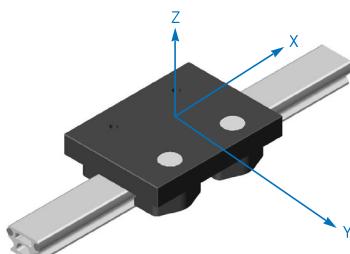

5. Service Life depending moment in any direction

$$L = \left(\frac{M_{xyz}}{M}\right)^3 \cdot 10^5$$

$$L_h = \frac{L}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L	: Service life	(m)
L _h	: Service life	(h)
M _{xyz}	: Allowable moment in each direction	(N · m)
M	: Applied moment in each direction	(N · m)
l _s	: Stroke	(m)
n ₁	: The number of Cycles	(o.p.m.)

* When applied moment is less than maximum allowable moment M_{xyz}, rating life shall be calculated from the equation above.

Viscosity, viscosity index	Pascal	Pa · s	Poise	P	10
Kinematic viscosity, Kinematic viscosity index	Square meter/second	m ² /s	Stokes Centistokes	St cSt	10 ⁴ 10 ⁶
Temperature, Temperature variation	Kelvin, Celsius	K, °C	Degree	°C	[See Note 1]
Current, magnetomotive force	Ampere	A	Ampere	A	1
Current, electromotive force	Volt	V	(Watt/ampere)	(W/A)	1
Magnetic intensity	Ampere per meter	A/m	Oersted	Oe	4π/10 ³
Magnetic flux density	Tesla	T	Gauss Gamma	Gs γ	10 ⁴ 10 ⁹
Electric resistance	Ohm	Ω	Ampere/volt	(V/A)	1

Note 1 Thetemperature conversion fromfrom TK to $\theta^\circ\text{C}$ is $\theta^\circ = T - 273.15$, but for a temperature variation, it is $\Delta T = \Delta\theta$. But ΔT and $\Delta\theta$ represent temperature variation measured using the Kelvin and Celsius scales respectively.

Remarks The names and symbols in parenthesis are equivalent to those directly above or on the left
Example 1N=1/9,809 65kg

2. N–kgf Conversion Table

[How to Read] For example, to convert 10N into kgf, read the figure in the right kgf column adjacent to the 10 in the center column in the 1st block. This means that 10N is 1.0197kgf. To convert 10kgf into N, read the figure in the left N column of the same row, which indicates that the answer is 98,066N.

$$\begin{aligned} 1\text{N} &= 0.1019716\text{kgf} \\ 1\text{kgf} &= 9.80665 \text{ N} \end{aligned}$$

N		kgf	N		kgf	N		kgf

3. kg-lb Conversion Table

[How to Read] For example, to convert 10kg into lb, read the figure in the right lb column adjacent to the 10 in the center column in the 1st block. This means that 10kg is 22,046lb. To convert 10lb into kg, read the figure in the left kg column of the same row, which indicates that the answer is 4.536kg.

$$\begin{aligned}1\text{kg} &= 2,2046226\text{lb} \\1\text{lb} &= 0.45359237\text{kg}\end{aligned}$$

kg		lb	kg		lb	kg		lb
